# A classification of metacyclic groups by group invariants <br> by <br> Àngel García-Blázquez ${ }^{(1)}$, Ángel del Río ${ }^{(2)}$ <br> Dedicated to Toma Albu and Constantin Năstăsescu on their 80 th birthdays 

#### Abstract

We obtain a new classification of the finite metacyclic groups in terms of group invariants. We present an algorithm to compute these invariants, and hence to decide if two given finite metacyclic groups are isomorphic, and another algorithm which computes all the metacyclic groups of a given order. A GAP implementation of these algorithms is given.

Key Words: Finite groups, metacyclic groups.
2020 Mathematics Subject Classification: Primary 20E99; Secondary 20D10.

## 1 Introduction

Classifying groups is a fundamental problem in group theory. Unfortunately it is a task which seems out of reach except for restricted families of groups. One of the classes which have received much attention is that of finite metacyclic groups. It is well known that every finite metacyclic group has a presentation of the following form

$$
\mathcal{G}_{m, n, s, t}=\left\langle a, b \mid a^{m}=1, b^{n}=a^{s}, a^{b}=a^{t}\right\rangle
$$

for natural numbers $m, n, s, t$ satisfying $s(t-1) \equiv t^{n}-1 \equiv 0 \bmod m$. However, the parameters $m, n, s$ and $t$ are not invariants of the group. Traditionally, the authors dealing with the classification of finite metacyclic groups select distinguished values of $m, n, s$ and $t$ so that each isomorphism class is described by a unique election of the parameters (see $[13,4,1,6,8,7,10,11,9,12])$. This approach was culminated by C.E. Hempel who presented a classification of all the finite metacyclic groups in [5]. However it is not clear how to use this classification to describe the distinguished parameters identifying a given metacyclic group and how those distinguished parameters are connected with group invariants.

The aim of this paper is to present an alternative classification of the finite metacyclic groups using a slightly different approach in terms of group invariants which allows an easy implementation. Namely, we associate to every finite metacyclic group $G$ a 4 -tuple $\operatorname{MCINV}(G)=\left(m_{G}, n_{G}, s_{G}, \Delta_{G}\right)$ where $m_{G}, n_{G}$ and $s_{G}$ play the role of $m, n$ and $s$ in the presentation above and $\Delta_{G}$ is a cyclic subgroup of units modulo a divisor of $m_{G}$. Our main result consists in proving that $\operatorname{MCINV}(G)$ is an invariant of the group $G$ which determines $G$ up to isomorphism, i.e. if $G$ and $H$ are two finite metacyclic groups then they are isomorphic if and only if MCINV $(G)=\operatorname{MCINV}(H)$ ( Theorem A). Moreover, we describe in Theorem B the possible values $(m, n, s, \Delta)$ of $\operatorname{MCINV}(G)$ and for such value we show how to find an
integer $t$ such that $\operatorname{MCINV}\left(\mathcal{G}_{m, n, s, t}\right)=(m, n, s, \Delta)$ (Theorem C). This allows a computer implementation of the following function: one which computes $\operatorname{MCINV}(G)$ for any given finite metacyclic group, and hence of another function which decide whether two metacyclic groups are isomorphic, and another one which computes all the metacyclic subgroups of a given order.

To define MCINV $(G)$ we need to introduce some notation. First of all, we adopt the convention that 0 is not a natural number, so $\mathbb{N}$ denotes the set of positive integers. Moreover by a prime we mean a prime in $\mathbb{N}$. If $m \in \mathbb{N}, p$ is a prime, $\pi$ is a set of primes and $A$ a finite abelian group then we denote

$$
\begin{aligned}
\pi(m) & =\text { set of primes dividing } m \\
\mathcal{U}_{m} & =\text { group of units of the ring } \mathbb{Z} / m \mathbb{Z} \\
m_{p} & =\text { maximum power of } p \text { dividing } m \\
m_{\pi} & =\prod_{p \in \pi} m_{p} \\
A_{\pi} & =\text { Hall } \pi \text {-subgroup of } A \\
A_{\pi^{\prime}} & =\text { Hall } \pi^{\prime} \text {-subgroup of } A .
\end{aligned}
$$

If $t \in \mathbb{Z}$ with $\operatorname{gcd}(t, m)=1$ then $[t]_{m}$ denotes the element of $\mathcal{U}_{m}$ represented by $t$ and $\langle t\rangle_{m}$ denotes the subgroup of $\mathcal{U}_{m}$ generated by $[t]_{m}$. If $q \mid m$ then $\operatorname{Res}_{q}: \mathcal{U}_{m} \rightarrow \mathcal{U}_{q}$ denotes the natural map, i.e. $\operatorname{Res}_{q}\left([t]_{m}\right)=[t]_{q}$.

Let $T$ be a cyclic subgroup of $\mathcal{U}_{m}$. Then we define $[T]=(r, \epsilon, o)$

$$
\begin{aligned}
r & =\text { greatest divisor of } m \text { such that } \operatorname{Res}_{r_{2^{\prime}}}(T)=1 \text { and } \operatorname{Res}_{r_{2}}(T) \subseteq\langle-1\rangle_{r_{2}} ; \\
\epsilon & = \begin{cases}-1, & \text { if } \operatorname{Res}_{r_{2}}(T) \neq 1 \\
1, & \text { otherwise. }\end{cases} \\
o & =\left|\operatorname{Res}_{m_{\nu}}\left(T_{\nu^{\prime}}\right)\right|, \text { with } \nu=\pi(m) \backslash \pi(r)
\end{aligned}
$$

If moreover, $n, s \in \mathbb{N}$ then we denote

$$
[T, n, s]=m_{\nu} \prod_{p \in \pi(r)} m_{p}^{\prime}
$$

with $m_{p}^{\prime}$ defined as follows:

$$
\text { if } \epsilon^{p-1}=1 \text { then } m_{p}^{\prime}=\min \left(m_{p}, o_{p} r_{p}, \max \left(r_{p}, s_{p}, r_{p} \frac{s_{p} o_{p}}{n_{p}}\right)\right)
$$

if $\epsilon=-1$ then

$$
m_{2}^{\prime}= \begin{cases}r_{2}, & \text { if either } o_{2} \leq 2 \text { or } m_{2} \leq 2 r_{2}  \tag{1.1}\\ \frac{m_{2}}{2}, & \text { if } 4 \leq o_{2}<n_{2}, 4 r_{2} \leq m, \text { and if } s_{2} \neq n_{2} r_{2} \text { then } 2 s_{2}=m_{2}<n_{2} r_{2} \\ m_{2}, & \text { otherwise }\end{cases}
$$

Let $A$ be a cyclic group of order $m$. Then the map $\sigma_{A}: \mathcal{U}_{m} \rightarrow \operatorname{Aut}(A)$ associating $[r]_{m}$ with the map $a \mapsto a^{r}$, is a group isomorphism. If moreover $A$ is a normal subgroup of a group $G$ then we define

$$
T_{G}(A)=\sigma_{A}^{-1}\left(\operatorname{Inn}_{G}(A)\right)
$$

where $\operatorname{Inn}_{G}(A)$ is formed by the restriction to $A$ of the inner automorphisms of $G$. We introduce notation for the entries of $T_{G}(A)$ by setting

$$
\left(r_{G}(A), \epsilon_{G}(A), o_{G}(A)\right)=\left[T_{G}(A)\right] .
$$

Definition 1.1. Let $G$ be a group. $A$ metacyclic kernel of $G$ is a normal subgroup $A$ of $G$ such that $A$ and $G / A$ are cyclic. $A$ metacyclic factorization of a group $G$ is an expression $G=A B$ where $A$ is a normal cyclic subgroup of $G$ and $B$ is a cyclic subgroup of $G$.
$A$ minimal kernel of $G$ is a kernel of $G$ of minimal order.
A metacyclic factorization $G=A B$ is said to be minimal in $G$ if $\left(|A|, r_{G}(A),[G: B]\right)$ is minimal in the lexicographical order. In that case we denote $m_{G}=|A|, n_{G}=[G: A]$, $s_{G}=[G: B]$ and $r_{G}=r_{G}(A)$.

Clearly a group is metacyclic if and only if it has metacyclic kernel if and only if it has a metacyclic factorization. Sometimes we abbreviate metacyclic kernel of $G$ or metacyclic factorization of $G$ and we simply say kernel of $G$ or factorization of $G$.

If $G=A B$ is a metacyclic factorization of $G$ then we denote

$$
\Delta(A B)=\operatorname{Res}_{[T, n, s]}(T), \quad \text { with } \quad T=T_{G}(A), \quad n=[G: A] \quad \text { and } \quad s=[G: B] .
$$

We will prove that $\Delta(A B)$ is constant for all the minimal metacyclic factorizations (Corollary 3.7). This allows to define the desired invariant:
$\operatorname{MCINV}(G)=(|A|,[G: A],[G: B], \Delta(A B))$, with $G=A B$ minimal factorization of $G$.
Our first result states that $\operatorname{MCINV}(G)$ determines $G$ up to isomorphisms, formally:
Theorem A. Two finite metacyclic groups $G$ and $H$ are isomorphic if and only if $\operatorname{MCINV}(G)=\operatorname{MCINV}(H)$.

Our next result describes the values realized as $\operatorname{MCINV}(G)$ with $G$ a finite metacyclic group.

Theorem B. Let $m, n, s \in \mathbb{N}$ and let $\Delta$ be a cyclic subgroup of $\mathcal{U}_{m^{\prime}}$ with $m^{\prime} \mid m$. Let $[\Delta]=[r, \epsilon, o]$ and $\nu=\pi(m) \backslash \pi(r)$. Then the following conditions are equivalent:

1. $(m, n, s, \Delta)=\operatorname{MCINV}(G)$ for some finite metacyclic group $G$.
2. (a) s divides $m,|\Delta|$ divides $n$ and $m_{\nu}=s_{\nu}=m_{\nu}^{\prime}$.
(b) (1.1) holds for every $p \in \pi(r)$.
(c) If $\epsilon=-1$ then $\frac{m_{2}}{r_{2}} \leq n_{2}, m_{2} \leq 2 s_{2}$ and $s_{2} \neq n_{2} r_{2}$. If moreover $4|n, 8| m$ and $o_{2}<n_{2}$ then $r_{2} \leq s_{2}$.
(d) For every $p \in \pi(r)$ with $\epsilon^{p-1}=1$, we have $\frac{m_{p}}{r_{p}} \leq s_{p} \leq n_{p}$ and if $r_{p}>s_{p}$ then $n_{p}<s_{p} o_{p}$.
Our last result shows how to construct a metacyclic group $G$ with given $\operatorname{MCINV}(G)$ : If $m, n, s \in \mathbb{N}$ with $s \mid m$ then we define the following subgroup of $\mathcal{U}_{m}$ :

$$
\mathcal{U}_{m}^{n, s}=\left\{[t]_{m}: m \mid s(t-1), \quad \text { and } \quad t^{n} \equiv 1 \quad \bmod m\right\} .
$$

If $T$ is a cyclic subgroup of $\mathcal{U}_{m}^{n, s}$ generated by $[t]_{m}$ then we denote

$$
\mathcal{G}_{m, n, s, T}=\mathcal{G}_{m, n, s, t}=\left\{a, b: a^{m}=1, b^{n}=a^{s}, a^{b}=a^{t}\right\}
$$

It is easy to see that the isomorphism type of this group is independent of the election of the generator $[t]_{m}$ of $T$ (Lemma 2.2.(5)). Moreover, the assumption $T \subseteq \mathcal{U}_{m}^{n, s}$ warranties that $|a|=m,\left|\mathcal{G}_{m, n, s, T}\right|=m n$ and $|b|=\frac{m n}{s}$.
Remark 1.2. Suppose that $m, n, s$ and $\Delta \leq \mathcal{U}_{m^{\prime}}$ satisfy the conditions of statement (2) in Theorem $B$ and $[\Delta]=(r, \epsilon, o)$. Then $\operatorname{Res}_{m_{p}^{\prime}}(\Delta)=\left\langle\epsilon^{p-1}+r_{p}\right\rangle_{m_{p}^{\prime}}$ for every $p \in \pi(r)$ and hence there is an integer $t^{\prime}$ such that $\Delta=\left\langle t^{\prime}\right\rangle_{m^{\prime}}$ and $t^{\prime} \equiv \epsilon^{p-1}+r_{p} \bmod m_{p}^{\prime}$ for every $p \in \pi(r)$. Using the Chinese Remainder Theorem we can select an integer $t$ such that $t \equiv t^{\prime} \bmod m^{\prime}$ and $t \equiv \epsilon^{p-1}+r_{p} \bmod m_{p}$ for every $p \in \pi(r)$ and let $T=\langle t\rangle_{m}$. Then $T \subseteq \mathcal{U}_{n}^{n, s}, \operatorname{Res}_{m^{\prime}}(T)=\Delta$ and $[T]=[\Delta]$. Then the following theorem ensures that $\operatorname{MCINV}\left(G_{m, n, s, T}\right)=(m, n, s, \Delta)$.

Theorem C. Let $m, n, s \in \mathbb{N}$ and let $\Delta$ be a cyclic subgroup of $\mathcal{U}_{m^{\prime}}$ with $m^{\prime} \mid m$. Suppose that they satisfy the conditions of (2) in Theorem $B$ and let $T$ be a cyclic subgroup of $\mathcal{U}_{m}^{n, s}$ such that $[T]=[\Delta]$ and $\operatorname{Res}_{m^{\prime}}(T)=\Delta$. Then $(m, n, s, \Delta)=\operatorname{MCINV}\left(\mathcal{G}_{m, n, s, T}\right)$.

For implementation it is convenient to replace the fourth entry of MCINV $(G)$ by a distinguished integer $t_{G}$ so that $G \cong \mathcal{G}_{m_{G}, n_{G}, s_{G}, t_{G}}$ and $G \cong H$ if and only if $\left(m_{G}, n_{G}, s_{G}, t_{G}\right)=$ $\left(m_{H}, n_{H}, s_{H}, t_{H}\right)$. We select $t_{G}$ satisfying the conditions of remark 1.2. In particular, $\left[t_{G}\right]_{m_{\pi}}$ is uniquely determined by the condition $t \equiv \epsilon^{p-1}+r_{p} \bmod m_{p}$ for every $p \in \pi(r)$. However there is not any natural election of $\left[t_{G}\right]_{m_{\pi^{\prime}}}$ and we simply take the minimum possible value. More precisely, if $(m, n, s, \Delta)=\operatorname{MCINV}(G),(r, \epsilon, o)=[\Delta]$ and $m^{\prime}$ is given by (1.1) then define

$$
t_{G}=\min \left\{t \geq 0: \operatorname{Res}_{m^{\prime}}\left(\langle t\rangle_{m}\right)=\Delta \quad \text { and } \quad t \equiv \epsilon^{p-1}+r_{p} \quad \bmod m_{p} \text { for every } p \in \pi(r)\right\}
$$

We call $\left(m_{G}, n_{G}, s_{G}, t_{G}\right)$ the list of metacyclic invariants of $G$. Clearly if $H$ is another metacyclic group then $G \cong H$ if and only if $G$ and $H$ have the same metacyclic invariants. Moreover, by Theorem C, if $(m, n, s, t)$ is the list of metacyclic invariants of $G$ then $G \cong$ $\mathcal{G}_{m, n, s, t}$.

We outline the contains of the paper: In Section 2 we introduce the general notation, not mentioned in this introduction, and present some preliminary technical results. In Section 3 we prove several lemmas on metacyclic factorizations aiming to an intrinsic description of when a metacyclic factorization is minimal. It includes an algorithm to obtain a minimal metacyclic factorization from an arbitrary one. This section concludes with Theorem 3.6 which is the keystone to prove Theorem A, Theorem B and Theorem C in Section 4. In Section 5 we introduce an algorithm to compute the metacyclic invariants of a given metacyclic group and use this to decide if two metacyclic groups are isomorphic, and another algorithm to construct all the metacyclic groups of a given order. We present also implementations in GAP [2] of these algorithms.

## 2 Notation and preliminaries

By default all the groups in this paper are finite. We use standard notation for a group $G$ : $Z(G)=$ center of $G, G^{\prime}=$ commutator subgroup of $G$, Aut $(G)=$ group of automorphisms of
$G$. If $g, h \in G$ then $|g|=$ order of $g, g^{h}=h^{-1} g h,[g, h]=g^{-1} g^{h}$. If $\pi$ is a set of primes then $g_{\pi}$ and $g_{\pi^{\prime}}$ denote the $\pi$-part and $\pi^{\prime}$-part of $g$, respectively. When $p$ is a prime we rather write $g_{p}$ and $g_{p^{\prime}}$ than $g_{\{p\}}$ and $g_{\{p\}^{\prime}}$, respectively. Similarly, if $G$ is a finite abelian group then $G_{p}$ and $G_{p^{\prime}}$ denote the $p$-part of $G$ and the $p^{\prime}$-part of $G$, respectively.

Let $G$ be a metacyclic group. Observe that $A$ is a kernel of $G$ if and only if $G$ has a metacyclic factorization of the form $G=A B$. In that case, if

$$
m=|A|, \quad n=[G: A], \quad s=[G: B] \quad \text { and } \quad T=T_{G}(A)=\langle t\rangle_{m}
$$

then $s\left|m,|B|=n \frac{m}{s}, T \subseteq \mathcal{U}_{m}^{n, s}\right.$ and $A$ and $B$ have generators $a$ and $b$, respectively, such that $b^{n}=a^{s}$ and $a^{b}=a^{t}$. Thus $G \cong \mathcal{G}_{m, n, s, T}$.

If $p$ is a prime then $v_{p}$ denotes the $p$-adic valuation on the integers.
Let $a \in \mathbb{Z}$ and $m \in \mathbb{N}$. If $\operatorname{gcd}(a, m)=1$ then $o_{m}(a)$ denotes the order of $[a]_{m}$ i.e. $o_{m}(a)=\min \left\{n \in \mathbb{N}: a^{n} \equiv 1 \bmod m\right\}$. If $a \neq 0$ then we denote

$$
\mathcal{S}(a \mid m)=\sum_{i=0}^{m-1} a^{i}= \begin{cases}m, & \text { if } a=1 \\ \frac{a^{m}-1}{a-1}, & \text { otherwise }\end{cases}
$$

This notation occurs in the following statement where $g$ and $h$ are elements of a group:

$$
\begin{equation*}
\text { If } g^{h}=g^{a} \text { then }(h g)^{m}=h^{m} g^{\mathcal{S}(a \mid m)} \tag{2.1}
\end{equation*}
$$

The following lemma collects some useful properties of the operator $\mathcal{S}(-\mid-)$ which will be used throughout.

Lemma 2.1. Let $p, R, m \in \mathbb{N}$ with $p$ prime and suppose that $R \equiv 1 \bmod p$.

1. Suppose that either $p \neq 2$ or $p=2$ and $R \equiv 1 \bmod 4$. Then
(a) $v_{p}\left(R^{m}-1\right)=v_{p}(R-1)+v_{p}(m)$ and $v_{p}(\mathcal{S}(R \mid m))=v_{p}(m)$.
(b) $o_{p^{m}}(R)=p^{\max \left(0, m-v_{p}(R-1)\right)}$.
(c) If $a=v_{p}(R-1) \leq m$ then $\langle R\rangle_{p^{m}}=\left\{\left[1+y p^{a}\right]_{p^{m}}: 0 \leq y<p^{m-a}\right\}$.
2. Suppose that $R \equiv-1 \bmod 4$. Then
(a) $v_{2}\left(R^{m}-1\right)= \begin{cases}v_{2}(R+1)+v_{2}(m), & \text { if } 2 \mid m ; \\ 1, & \text { otherwise; }\end{cases}$ and $v_{2}(\mathcal{S}(R \mid m))=\left\{\begin{array}{ll}v_{2}(R+1)+v_{2}(m)-1, & \text { if } 2 \mid m ; \\ 0, & \text { otherwise; }\end{array}\right.$.
(b) $o_{2^{m}}(R)=\left\{\begin{array}{ll}1, & \text { if } m \leq 1 ; \\ 2^{\max \left(1, m-v_{2}(R+1)\right)}, & \text { otherwise }\end{array}\right.$.
(c) $v_{2}\left(R^{m}+1\right)=\left\{\begin{array}{ll}v_{2}(R+1), & \text { if } 2 \nmid m ; \\ 1, & \text { otherwise. }\end{array}\right.$.

Proof. (1a) The first equality can be easily proven by induction on $m$. Then the second follows from $R^{m}-1=(R-1) \mathcal{S}(R \mid m)$.
(1b) is a direct consequence of (1a).
(1c) By (1a) we have $\langle R\rangle_{p^{m}} \subseteq\left\{\left[1+y p^{a}\right]_{p^{m}}: 0 \leq y<p^{m-a}\right\}$ and by (1b) the first set has $p^{m-a}$ elements. As the second one has the same cardinality, equality holds.
(2a) Suppose that $R \equiv-1 \bmod 4$. If $2 \nmid m$ then $R^{m} \equiv-1 \bmod 4$ and hence $v_{2}\left(R^{m}-\right.$ $1)=1$. As $R^{2} \equiv 1 \bmod 4$, if $2 \mid m$ then, by (1a) we have $v_{2}\left(R^{m}-1\right)=v_{2}\left(\left(R^{2}\right)^{\frac{m}{2}}-1\right)=$ $v_{2}\left(R^{2}-1\right)+v_{2}\left(\frac{m}{2}\right)=v_{2}(R+1)+v_{2}(m)$. This proves the first part of $(2 \mathrm{a})$. Then the second part follows from $R^{m}-1=(R-1) \mathcal{S}(R \mid m)$.
(2b) follows easily from (2a).
(2c) Since $R$ is odd, both $R^{m}-1$ and $R^{m}+1$ and are even and exactly one of $v_{2}\left(R^{m}-1\right)$ and $v_{2}\left(R^{m}+1\right)$ equals 1. Thus, from (2a) we deduce that if $2 \mid m$ then $v_{2}\left(R^{m}+1\right)=1$. Suppose otherwise that $m$ is odd and greater than 2 . Then $v_{2}\left(R^{m-1}-1\right)=v_{2}(R+1)+v_{2}(m-1)>$ $v_{2}(R+1)$, so that $v_{2}\left(R^{m}+1\right)=v_{2}\left(R\left(R^{m-1}-1+1\right)+1\right)=v_{2}\left(R+1+R\left(R^{m-1}-1\right)\right)=v_{2}(R+1)$.

The following lemma follows by straightforward arguments.
Lemma 2.2. Let $m, n, s \in \mathbb{N}$, let $T$ be a cyclic subgroup of $\mathcal{U}_{m}$, and denote $(r, \epsilon, o)=[T]$, $m^{\prime}=[T, n, s]$ and $\Delta=\operatorname{Res}_{m^{\prime}}(T)$.

1. If $T=\langle t\rangle_{m}$ then $|T|=o_{m}(t), r_{2}=\max \left(\operatorname{gcd}\left(m_{2}, t-1\right), \operatorname{gcd}\left(m_{2}, t+1\right)\right)=\operatorname{gcd}\left(m_{2}, t-\epsilon\right)$, $r_{2^{\prime}}=\operatorname{gcd}\left(m_{2^{\prime}}, t-1\right)$, and $o=o_{m_{\nu}}(t)_{\nu^{\prime}}$ with $\nu=\pi(m) \backslash \pi(r)$.
2. $r\left|m^{\prime}\right| m$ and $\pi(m)=\pi\left(m^{\prime}\right)$.
3. $[T]=[\Delta]$.
4. For every $p \in \pi(r)$ we have $\operatorname{Res}_{m_{p}}\left(T_{p}\right)=\left\langle\epsilon^{p-1}+r_{p}\right\rangle_{m_{p}}$ and

$$
\left|\operatorname{Res}_{m_{p}}\left(T_{p}\right)\right|= \begin{cases}2, & \text { if } p=2, \epsilon=-1 \text { and } r_{2}=m_{2} \\ \frac{m_{p}}{r_{p}}, & \text { otherwise }\end{cases}
$$

5. If $s \mid m$ and $T \subseteq \mathcal{U}_{m}^{n, s}$ then $m_{\pi(r)}\left|r n, m_{\pi(r)}\right| r s, o \mid n_{\pi(m) \backslash \pi(r)}$ and if $\epsilon=-1$ then $m_{2} \in\left\{s_{2}, 2 s_{2}\right\}$. If moreover $T=\langle t\rangle_{m}=\langle u\rangle_{m}$ then there is a $k \in \mathbb{N}$ with $\operatorname{gcd}(k,|T|)=1$ and $a \mapsto a^{k}, b \mapsto b^{k}$ defines an isomorphism $\mathcal{G}_{m, n, s, t} \rightarrow \mathcal{G}_{m, n, s, u}$.

Definition 2.3. Given $m, n, s \in \mathbb{N}$ with $s \mid m$ and a cyclic subgroup of $\mathcal{U}_{m}$, we say that $T$ is ( $n, s$ )-canonical if $T \subseteq \mathcal{U}_{m}^{n, s}$ and if $(r, \epsilon, o)=[T]$ then the following conditions are satisfied:
(Can-) If $\epsilon=-1$ then $s_{2} \neq r_{2} n_{2}$. If moreover, $m_{2} \geq 8, n_{2} \geq 4, o_{2}<n_{2}$ then $r_{2} \leq s_{2}$.
(Can+) For every $p \in \pi$ with $\epsilon^{p-1}=1$ we have $s_{p} \mid n$ and $r_{p} \mid s$ or $s_{p} o_{p} \nmid n$.

## 3 Metacyclic factorizations

In this section $G$ is a finite metacyclic group. Moreover we fix the following notation:

$$
\begin{aligned}
\pi & =\text { set of prime divisors of }|G| \text { such that } G \text { has a normal Hall } p^{\prime} \text {-subgroup, } \\
\pi^{\prime} & =\pi(|G|) \backslash \pi \\
o_{G} & =\left|\operatorname{Inn}_{G}\left(G^{\prime} \pi^{\prime}\right)\right|_{\pi}
\end{aligned}
$$

In our first lemma we show that $\pi, \pi^{\prime}$ and $o_{G}$ are determined by any kernel of $G$.
Lemma 3.1. Let $G=A B$ be a metacyclic factorization and let $m=|A|, s=[G: A]$, $r=r_{G}(A)$ and $o=o_{G}(A)$. Then

1. For every set of primes $\mu, A_{\mu} B_{\mu}$ is a Hall $\mu$-subgroup of $G$.
2. $p \in \pi^{\prime}$ if and only if $G^{\prime} \backslash Z(G)$ has an element of order $p$ if and only if $A \backslash Z(G)$ has an element of order $p$.
3. $G^{\prime}{ }_{\pi^{\prime}}=A_{\pi^{\prime}}$ and $A_{\pi^{\prime}} \cap B_{\pi^{\prime}}=1$.
4. $\pi^{\prime}=\pi(m) \backslash \pi(r), s_{\pi^{\prime}}=m_{\pi^{\prime}}$ and $o=o_{G}$.
5. $G=A_{\pi^{\prime}} \rtimes\left(B_{\pi^{\prime}} \times \prod_{p \in \pi} A_{p} B_{p}\right)$. In particular $\left[B_{p^{\prime}}, A_{p}\right]=1$ for every $p \in \pi$.

Proof. (1) As $A$ is normal in $G, A_{\mu} B_{\mu}$ is a $\mu$-subgroup of $G$ and $A_{\mu^{\prime}} B_{\mu^{\prime}}$ is a $\mu^{\prime}$-subgroup of $G$. Moreover $G=A B=A_{\mu} B_{\mu} A_{\mu^{\prime}} B_{\mu^{\prime}}$ and hence $\left[G: A_{\mu} B_{\mu}\right]=\left|A_{\mu^{\prime}} B_{\mu^{\prime}}\right|$. Thus $A_{\mu} B_{\mu}$ is a Hall $\mu$-subgroup of $G$.
(2) As $G / A$ is abelian, $G^{\prime} \subseteq A$. Let $p \in \pi(|G|)$. If $p \nmid m$ then $A B_{p^{\prime}}$ is a normal Hall $p^{\prime}$-subgroup of $G$ and hence $p \in \pi$. Suppose otherwise that $p \mid m$ and let $C$ be the unique subgroup of order $p$ in $A$. Since $C$ is normal in $G$, it follows that $G^{\prime} \backslash Z(G)$ has an element of order $p$ if and only if $A \backslash Z(G)$ has an element of order $p$ if and only if $C \nsubseteq Z(G)$. Since Aut $(C)$ is cyclic of order $p-1$, if $p \in \pi$ and $N$ is a normal Hall $p^{\prime}$-subgroup of $G$ then $G=N \rtimes P$ with $P$ a Sylow $p$-subgroup of $G$ containing $C$ and as $[P, C]=1$ it follows that $[G, C] \subseteq[N, C] \subseteq N \cap C=1$ and hence $C \subseteq Z(G)$. Conversely, if $C \subseteq Z(G)$ then $\left[A_{p}, A_{p^{\prime}} B_{p^{\prime}}\right]=1$ because the kernel of the restriction homomorphism $\operatorname{Aut}\left(A_{p}\right) \rightarrow \operatorname{Aut}(C)$ is a $p$-group. As $A_{p^{\prime}} B$ normalizes $A_{p^{\prime}} B_{p^{\prime}}$ it follows that the latter is a normal Hall $p^{\prime}$-subgroup of $G$ and hence $p \in \pi$.
(3) Let $p \in \pi^{\prime}, c$ an element of order $p$ in $A$ and $a$ a generator of $A$. Since $|\operatorname{Aut}(\langle c\rangle)|=p-1$ and $c \notin Z(G)$, we have that $a_{p}^{b}=a_{p}^{k}$ for some integer $k$ such that $\operatorname{gcd}(k, p)=1$. Moreover, $k-1$ is coprime with $p$ because $1 \neq[c, b]=c^{k-1}$. Then $A_{p}=\left\langle a_{p}^{k-1}\right\rangle \subseteq G^{\prime}$ and hence $A_{p}=G^{\prime}{ }_{p}$. Moreover, if $g \in A_{p} \cap B_{p} \backslash\{1\}$ then $[g, B]=1$ and $c \in\langle g\rangle$, yielding a contradiction. Thus $A_{p} \cap B_{p}=1$. Since this is true for each $p \in \pi^{\prime}$, we have $A_{\pi^{\prime}}=G_{\pi^{\prime}}^{\prime}$ and $A_{\pi^{\prime}} \cap B_{\pi^{\prime}}=1$.
(4) is a direct consequence of (2) and (3).
(5) By (1) and (3), $A_{\pi^{\prime}} B_{\pi^{\prime}}=A_{\pi^{\prime}} \rtimes B_{\pi^{\prime}}$ is the unique Hall $\pi^{\prime}$-subgroup of $G$ and hence $G=\left(A_{\pi^{\prime}} \rtimes B_{\pi^{\prime}}^{\prime}\right) \rtimes\left(A_{\pi} B_{\pi}\right)$. Moreover, if $p \in \pi$ and $c$ is an element of order $p$ in $A_{p}$ then $c \in Z(G)$ by (2). This implies that $\left[B_{p^{\prime}}, A_{p}\right]=1$ because the kernel of $\operatorname{Res}_{p}: \operatorname{Aut}\left(A_{p}\right) \rightarrow$ $\operatorname{Aut}(\langle c\rangle)$ is a $p$-group. Then $\left[B_{\pi^{\prime}}, A_{\pi} B_{\pi}\right]=1$ and $A_{\pi} B_{\pi}=\prod_{p \in \pi} A_{p} B_{p}$.

Next lemma shows that $\epsilon_{G}$ is determined by any minimal kernel of $G$.
Lemma 3.2. If $A$ is a minimal kernel of $G$ then $\epsilon_{G}=\epsilon_{G}(A)$.
Proof. Let $m=m_{G}=|A|, \epsilon=\epsilon_{G}(A)$ and $r=r_{G}(A)$. If $m_{2} \leq 2$ then $\epsilon=1=\epsilon_{G}$. Otherwise $4 \mid r_{2}$ and

$$
G_{2}^{\prime}= \begin{cases}\left\langle a^{r_{2}}\right\rangle, & \text { if } \epsilon=1 \\ \left\langle a^{2}\right\rangle, & \text { if } \epsilon=-1\end{cases}
$$

Then

$$
\left|G_{2}^{\prime}\right|= \begin{cases}\frac{m_{2}}{r_{2}}, & \text { if } \epsilon=1 \\ \frac{m_{2}}{2}, & \text { if } \epsilon=-1\end{cases}
$$

and hence $\epsilon=-1$ if and only if $m_{2}=2\left|G^{\prime}{ }_{2}\right|>2$ if and only if $\epsilon_{G}=-1$.

Let

$$
R_{G}=\left\{r_{G}(A): A \text { is a minimal kernel of } G\right\}
$$

Next lemma shows that $\left|R_{G}\right| \leq 2$ and in most cases $\left|R_{G}\right|=1$.
Lemma 3.3. Let $m=m_{G}, n=n_{G}$ and $o=o_{G}$. Then the following statements are equivalent:

1. $\left|R_{G}\right|>1$.
2. $n_{2} \geq 4, m_{2} \geq 8, \epsilon_{G}=-1, o_{2}<n_{2}$ and $R_{G}=\left\{\frac{r}{2}, r\right\}$ for some $r$ with $r_{2}=m_{2}$.
3. $n_{2} \geq 4, m_{2} \geq 8, \epsilon_{G}=-1, o_{2}<n_{2}, r_{2} \in\left\{\frac{m_{2}}{2}, m_{2}\right\}$ for some $r \in R_{G}$ and $[G: B]_{2}=\frac{m_{2}}{2}$ for some metacyclic factorization $G=A B$ with $m=|A|$.
4. $n_{2} \geq 4, m_{2} \geq 8, \epsilon_{G}=-1, o_{2}<n_{2}, r_{2} \in\left\{\frac{m_{2}}{2}, m_{2}\right\}$ for some $r \in R_{G}$ and $[G: B]_{2}=\frac{m_{2}}{2}$ for every metacyclic factorization $G=A B$ with $m=|A|$.

Furthermore, suppose that $G=A B$ is a metacyclic factorization satisfying the conditions of (3) and let $a$ be a generator of $A$ and $b$ be a generator of $B$ and $s=[G: B]$. Let $C=\left\langle b^{\frac{n m_{2} \prime}{2 s_{2} \prime}} a\right\rangle$. Then $G=C B$ is another metacyclic factorization with $|C|=m$ and $r_{G}(C) \neq r_{G}(A)$.

Proof. Let $\epsilon=\epsilon_{G}, o=o_{G}, R=R_{G}$ and for every $p \in \pi$ let $R_{p}=\left\{r_{p}: r \in R\right\}$. Fix a minimal kernel $A$ of $G$ and let $r=r_{G}(A)$.

Let $p \in \pi$. If $\epsilon^{p-1}=1$ then $\left|G^{\prime}{ }_{p}\right|=\frac{m_{p}}{r_{p}}$. Thus in this case $\left|R_{p}\right|=1$. Therefore $r_{2^{\prime}}$ is constant for every $r \in R$ and hence $|R|=\left|R_{2}\right|$. Moreover, if $\epsilon=1$ then $G_{2}^{\prime}=\frac{m_{2}}{r_{2}}$ and hence $R_{2}=\left\{\frac{m_{2}}{\left|G^{\prime}{ }_{2}\right|}\right\}$. In this case none of the conditions (1)-(4) hold. Otherwise, $4\left|r_{G}(A)_{2}\right| m_{2}$. Thus, if $m_{2}<8$ then $r_{G}(A)_{2}=4$ for every minimal kernel $A$ of $G$ and hence $|R|=\left|R_{2}\right|=1$, so that again none of the conditions (1)-(4) hold. Thus in the remainder of the proof we assume that $\epsilon=-1$ and $8 \leq m_{2}$. Then $G^{\prime}{ }_{2}=A^{2}$ and hence $\left\langle-1+r_{G}(A)_{2}\right\rangle_{\frac{m_{2}}{2}}=\operatorname{Res} \frac{m_{2}}{2}\left(\mathbb{T}_{G}(A)\right)=$ $\sigma_{G^{\prime} 2}^{-1}\left(\operatorname{Inn}_{G}\left(G^{\prime}{ }_{2}\right)\right)$, which is independent of $A$. This shows that if $R_{2}$ contains an element
smaller than $\frac{m_{2}}{2}$ then it only has one element and hence again none of the conditions (1)-(4) holds. So in the remainder of the proof we assume that $R_{2} \subseteq\left\{\frac{m_{2}}{2}, m_{2}\right\}$.

Suppose that $o_{2}=n_{2}$. Then, by Lemma 3.1.(4), $C_{G}\left(G^{\prime} \pi^{\prime}\right)_{2}=A_{2}$, and hence

$$
\left\langle-1+r_{G}(A)_{2}\right\rangle_{m_{2}}=\operatorname{Res}_{m_{2}}\left(T_{G}\left(C_{G}\left(G_{\pi^{\prime}}^{\prime}\right)_{2}\right)\right)
$$

is independent of $A$. Therefore, in this case $\left|R_{2}\right|=1$, so that $|R|=1$. So again in this case none of the conditions (1)-(4) hold and in the remainder of the proof we also assume that $o_{2}<n_{2}$.

Suppose that $n_{2}<4$. Then none of the condition (2)-(4) holds and as $\epsilon=-1$, we have $n_{2}=2$. By means of contradiction suppose that (1) holds. By the previous paragraph $R_{2}=\left\{\frac{m_{2}}{2}, m_{2}\right\}$ and hence $G$ has two minimal kernels $A$ and $C$ with $r_{G}(A)_{2}=m_{2}$ and $r_{G}(C)_{2}=\frac{m_{2}}{2}$. If $G=A B$ and $G=C D$ are metacyclic factorization of $G$ then $A_{2} B_{2}$ and $C_{2} D_{2}$ are Sylow 2-subgroups of $G$ and hence they are isomorphic. However, by Lemma 2.2.(5), $\left[A_{2} B_{2}: B_{2}\right]$ is either $m_{2}$ or $\frac{m_{2}}{2}$. In the first case $A_{2} B_{2}$ is dihedral and in the second case $A_{2} B_{2}$ is quaternionic. This yields a contradiction because from $r_{G}(C)_{2}=\frac{m_{2}}{2}$ it follows that $C_{2} D_{2}$ is neither dihedral nor quaternionic.

Thus in the remainder we assume that $m_{2} \geq 8, n_{2} \geq 4, o_{2}<n_{2}, \epsilon=-1$ and $R_{2} \subseteq$ $\left\{\frac{m_{2}}{2}, m_{2}\right\}$. Moreover, by the above arguments we have that $R \subseteq\left\{\frac{r}{2}, r\right\}$ for some $r$ with $r_{2}=m_{2}$. Thus (1) and (2) are equivalent.
(4) implies (3) is clear.
(3) implies (2). Let $G=A B$ be a metacyclic factorization of $G$ satisfying the conditions of (3). Let $s=[G: B]$ and $r=r_{G}(A)$. Select generators $a$ of $A$ and $b$ of $B$ and let $z=b^{\frac{n m_{2^{\prime}}}{2 s_{2}}}$, $c=z a$ and $C=\langle c\rangle$. We will prove that if $G=C B$ is another metacyclic factorization with $|C|=m$ and $r_{G}(C) \neq r$, so that (2) holds. Indeed, since $o_{2}<n_{2}$, we have $\left[z, a_{\pi^{\prime}}\right]=1$. Moreover, $\left[z_{p^{\prime}}, a_{p}\right]=1$ for every $p \in \pi$. If moreover, $p \neq 2$ then $\left[z_{p}, a_{p}\right]=1$ because $\left[b^{n}, a\right]=1$. Finally, $r_{2} \in\left\{\frac{m_{2}}{2}, m_{2}\right\}$ and hence $o_{m_{2}}\left(-1+r_{2}\right)=2$. As $4 \mid n$ and $a_{2}^{b_{2}}=a_{2}^{-1+r_{2}}$ it follows that $\left[z_{2}, a_{2}\right]=1$. This shows that $z \in Z(G)$. As $s=[G: B]$ and $[G: A]=n$ we have $b^{n}=a^{s x}$ for some integer $x$ coprime with $m$. Then $c^{2}=a^{2+s x \frac{m_{2^{\prime}}}{s_{2^{\prime}}}}=a^{2+x s_{2} m_{2^{\prime}}}=a^{2+x \frac{m}{2}}=a^{2+\frac{m}{2}}$. As $8 \mid m$ it follows that $|C|=m$. Suppose that $a^{b}=a^{t}$. Then $t+1 \equiv r_{2} \bmod m_{2}$. Let $r^{\prime} \in \mathbb{N}$ with $r_{2^{\prime}}^{\prime}=r_{2^{\prime}}$ and $\left\{r_{2}, r_{2}^{\prime}\right\}=\left\{\frac{m_{2}}{2}, m_{2}\right\}$ and let $t^{\prime}$ be an integer such that $t^{\prime} \equiv t \bmod m_{2^{\prime}}$ and $t^{\prime} \equiv-1+r_{2}^{\prime} \bmod m_{2}$. As $8 \mid m$ we have $t^{\prime} \equiv t \equiv-1 \bmod 4$ and hence $t^{\prime}=1+2 y$ for some odd integer $y$. Then $c^{t^{\prime}}=z z^{t^{\prime}-1} a^{t^{\prime}}=z z^{2 y} a^{t^{\prime}}=z a^{t^{\prime}+y \frac{m}{2}}$. Moreover, $t^{\prime}+y \frac{m}{2} \equiv t^{\prime} \equiv t$ $\bmod m_{2^{\prime}}$ and $t^{\prime}+y \frac{m}{2} \equiv-1+r_{2}^{\prime}+\frac{m_{2}}{2} \equiv-1+r_{2} \equiv t \bmod m_{2}$. Therefore $c^{t^{\prime}}=z a^{t}=c^{b}$. This shows that $C$ is a cyclic normal subgroup of $G$ and clearly $G=C B$ is a metacyclic factorization satisfying the desired condition.

Before proving (1) implies (4) we prove that if $G=A B=C D$ are metacyclic factorizations with $|A|=|B|=m$ then $[G: B]_{2}=[G: D]_{2}$. The assumption $\epsilon=-1$ implies that $G^{\prime}{ }_{2}=A^{2}=C^{2}$. As $A_{2} B_{2}$ and $C_{2} D_{2}$ are Sylow 2-groups of $G$ we may assume that they are equal and hence if $A_{2}=\langle a\rangle$ and $B=\langle b\rangle$ we may write $c=b^{i} a^{j}$ and $d=b^{k} a^{l}$. Since $c^{2} \in C^{2}=A^{2}$ we have $\left.\frac{n_{2}}{2} \right\rvert\, i$ and as $4 \mid n$, necessarily $2 \mid i$ and hence $2 \nmid k$. Then, using that $r_{G}(A), r_{G}(C) \in\left\{\frac{m_{2}}{2}, m_{2}\right\}$ we have that $d^{2}=b^{2 k}$ or $d^{2}=b^{2 k} a^{l \frac{m_{2}}{2}}$. In both cases $d^{4}=b^{4}$ and hence $D^{4}=B^{4}$. As $4 \mid n$ it follows that $A_{2} \cap B_{2}=B_{2}^{n_{2}}=D_{2}^{n_{2}}=C_{2} \cap D_{2}$. Therefore, $[G: B]_{2}=\left[A_{2} B_{2}: B_{2}\right]=\left[A_{2}, A_{2} \cap B_{2}\right]=\left[C_{2}: C_{2} \cap D_{2}\right]=[G, D]_{2}$, as desired.
(1) implies (4). Suppose that $|R|>1$. By the assumptions and the previous arguments we know that the only condition from (4) which is not clear is that if $G=A B$ is a metacyclic
factorization with $m=|A|$ and $s=[G: B]$ then $s_{2}=\frac{m_{2}}{2}$. So suppose that $s_{2}=m_{2}$. Since $|R|>1$, there is a second metacyclic factorization $G=C D$ with $|C|=m$ and $\left\{r_{G}(A)_{2}, r_{G}(C)_{2}\right\}=\left\{\frac{m_{2}}{2}, m_{2}\right\}$. By the previous paragraph $[G: D]_{2}=[G: B]_{2}=1$. By symmetry we may assume that $r_{G}(A)_{2}=m_{2}$ and $r_{G}(C)=\frac{m_{2}}{2}$. As above we may assume that $A_{2} B_{2}=C_{2} D_{2}$ and if $A_{2}=\langle a\rangle, B_{2}=\langle b\rangle, C_{2}=\langle c\rangle$ and $D_{2}=\langle d\rangle$ then $a^{b}=a^{-1}$, $c^{d}=c^{-1+\frac{m_{2}}{2}}, G_{2}^{\prime}=A_{2}^{2}=C_{2}^{2}, A_{2} \neq C_{2}$ and $A_{2} \cap B_{2}=C_{2} \cap D_{2}=1$. Write $c=b^{i} a^{j}$ and $d=b^{k} a^{l}$ with $i, j, k, l \in \mathbb{N}$. Since $c^{2} \in A$ we have that $\left.\frac{n_{2}}{2} \right\rvert\, i$ and as $4 \mid n_{2}$, we have that $k$ is odd and $\left[b^{i}, a\right]=1$. Thus $b^{2 i}=c^{2} a^{-2 j} \in A_{2} \cap B_{2}=1$. Then $c^{2}=a^{2 j}$ and as $C^{2}=A^{2}$, necessarily $j$ is odd. However, from $b^{2 i}=1,\left[b^{i}, a\right]=1$ and $8 \mid m$ we have $b_{2}^{i} a_{2}^{\left(-1+\frac{m_{2}}{2}\right) j}=b_{2}^{\left(-1+\frac{m_{2}}{2}\right) i} a_{2}^{\left(-1+\frac{m_{2}}{2}\right) j}=c_{2}^{-1+\frac{m_{2}}{2}}=c_{2}^{d}=b_{2}^{i} a_{2}^{-j}$ and hence $2 \mid j$, a contradiction.

In our next result we show a way to decide if a factorization of $G$ is minimal and we prove that the following algorithm transforms a metacyclic factorization of $G$ into a minimal one.

Algorithm 1. Input: A metacyclic factorization $G=A B$ of a finite group $G$.
Output: $a, b \in G$ with $G=\langle a\rangle\langle b\rangle$ a minimal metacyclic factorization of $G$.

1. $m:=|A|, n:=[G: A], s:=[G: B]$,
2. $a:=$ some generator of $A, b:=$ some generator of $B$, and $y \in \mathbb{N}$ with $b^{n}=a^{y}$.
3. $r:=r_{G}(A), \epsilon:=\epsilon_{G}(A)$ and $o=o_{G}(A)$.
4. for $p \in \pi(r)$ with $\epsilon^{p-1}=1$
(a) if $s_{p} \nmid n$ then $b:=b a_{p}$ and $s:=s_{p^{\prime}} n_{p}$.
(b) if $r_{p} \nmid s, s_{p} o_{p} \mid n$ and $t \in \mathbb{N}$ satisfy $a_{p}^{b_{p}}=a_{p}^{t}$, compute $x \in \mathbb{N}$ satisfying $x \mathcal{S}\left(\left.t^{\frac{n}{s_{p}}} \right\rvert\, s_{p}\right) \equiv r-y \bmod m_{p}$ and set $a:=b_{p}^{\frac{n}{s_{p}}} a_{p^{\prime}} a_{p}^{x}, m:=s_{p} \frac{m}{r_{p}}, n:=n \frac{r_{p}}{s_{p}}$, and

$$
(r, \epsilon):=\left\{\begin{array}{l}
\left(4 r_{2^{\prime}},-1\right), \quad \text { if } 8 \mid m, s_{p}=2, \text { and } r_{2}=\frac{m_{2}}{2} \\
\left(r_{p^{\prime}} s_{p}, 1\right), \quad \text { otherwise } .
\end{array}\right.
$$

5. If $\epsilon=-1,4|n, 8| m, o_{2}<n_{2}$ and $r_{2} \nmid s$ then $a:=b^{\frac{m_{2^{\prime}} n}{2 s_{2^{\prime}}}}$ a and $r:=r_{2^{\prime}} s_{2}$
6. If $\epsilon=-1$ and $s_{2}=r_{2} n_{2}$ then $b:=b a_{2}$ and $s:=\frac{s}{2}$.
7. Return $(a, b)$.

Proposition 3.4. Let $G=A B$ be a metacyclic factorization and let $m=|A|, n=[G: A]$, $s=[G: B]$ and $T=T_{G}(A)$. Then $G=A B$ is minimal as metacyclic factorization of $G$ if and only if $T$ is $(n, s)$-canonical.

Furthermore, if the input of Algorithm 1 is a metacyclic factorization of $G$ and its output is $(a, b)$ then $G=\langle a\rangle\langle b\rangle$ is a minimal metacyclic factorization of $G$.

Proof. Let $(r, \epsilon, o)=\left[T_{G}(A)\right]$. By Lemma 3.1, $\pi^{\prime}=\pi(m) \backslash \pi(r)$. Fix $y, t \in \mathbb{N}$ with $b^{n}=a^{y}$ and $a^{b}=a^{t}$. Then $s=\operatorname{gcd}(t, m), \operatorname{gcd}(t, m)=1, r_{2^{\prime}}=\operatorname{gcd}\left(m_{2^{\prime}}, t-1\right)$ and $r_{2}=\operatorname{gcd}\left(m_{2}, t-\epsilon\right)$. For every prime $p$ let $G_{p}=A_{p} B_{p}$.

Claim 1. If condition (Can + ) holds then $A$ is a minimal kernel of $G$.
Suppose that condition (Can+) holds and let $C$ be kernel of $G$. We want to prove that $|C| \geq m$ and for that it is enough to show that $\left|C_{p}\right| \geq m_{p}$ for every prime $p$. This is obvious if $m_{p}=1$, and it is a consequence of Lemma 3.1.(3), if $p \in \pi^{\prime}$. So we suppose that $p \in \pi$ and $m_{p} \neq 1$. Hence $p \mid r$.

Suppose first that $\epsilon^{p-1}=-1$. Then $p=2$ and $A_{2}^{2}=G_{2}^{\prime} \subseteq C_{2}$. However $C_{2} \nsubseteq A_{2}^{2}$ because $G_{2} / A_{2}^{2}$ is not cyclic. Therefore $\left|C_{2}\right| \geq 2\left|A_{2}^{2}\right|=m_{2}$.

Suppose otherwise that $\epsilon^{p-1}=1$. Then $G_{p}^{\prime}=A_{p}^{r_{p}}$ and $\left|G^{\prime}{ }_{p}\right|=\frac{m_{p}}{r_{p}}$. Assume that $r_{p} \mid s_{p}$. Then $G_{p} / G_{p}^{\prime}=\left(A_{p} / G_{p}^{\prime}\right) \times\left(B_{p} G_{p}^{\prime} / G_{p}^{\prime}\right)$ and $r_{p}=\left|A_{p} / G_{p}^{\prime}\right| \leq n_{p}=\left[B_{p} G_{p}^{\prime}: G_{p}^{\prime}\right]$. As $\left(G_{p} / G^{\prime}{ }_{p}\right) /\left(C_{p} / G^{\prime}{ }_{p}\right) \cong G_{p} / C_{p}$ is cyclic, necessarily $r_{p} \mid\left[C_{p}: G_{p}^{\prime}\right]$ and hence $m_{p}| | C_{p} \mid$, as desired. Assume otherwise that $r_{p} \nmid s_{p}$. By condition (Can+) we have $s_{p} \mid n_{p}$ and $s_{p} o_{p} \nmid n_{p}$. In particular $p \mid o_{p}$. By Lemma 3.1.(3), $C_{\pi^{\prime}}=A_{\pi^{\prime}}$ and thence $C_{p} \subseteq C_{G_{p}}\left(A_{\pi^{\prime}}\right)_{p}=A_{p} B_{p}^{o_{p}}$. Using again that $G_{p} / C_{p}$ is cyclic and $p \mid o_{p}$, we must have $C_{p}=\left\langle b_{p}^{x} a_{p}\right\rangle$ for $x \in \mathbb{N}$ with $o_{p} \mid x$ and $x \leq n$. Let $R \in \mathbb{N}$ such that $a_{p}^{b_{p}^{x}}=a_{p}^{R}$. Then $R$ satisfies the hypothesis of Lemma 2.1.(2c) and hence $v_{p}\left(\mathcal{S}\left(R \left\lvert\, \frac{n}{x_{p}}\right.\right)\right)=v_{p}(n)-v_{p}(x) \leq v_{p}(n)-v_{p}(o)<v_{p}(s)=v_{p}\left(y x_{p^{\prime}}\right)$ and therefore $v_{p}\left(y x_{p^{\prime}}+\mathcal{S}\left(R \left\lvert\, \frac{n}{x_{p}}\right.\right)\right)=v_{p}(n)-v_{p}(x)$. Then $\left.\left.\left|C_{p}\right|=\frac{n_{p}}{x_{p}}\left|\left(b_{p}^{x} a_{p}\right)^{\frac{n_{p}}{x_{p}}}\right|=\frac{n_{p}}{x_{p}} \right\rvert\, a_{p}^{y x_{p^{\prime}}+\mathcal{S}\left(R \left\lvert\, \frac{n_{p}}{x_{p}}\right.\right.}\right) \mid=$ $m_{p}$. This finishes the proof of Claim 1.
Claim 2. If $T_{G}(A)$ is $(n, s)$-canonical then for every metacyclic factorization $G=C D$ with $|C|=m$ one has $r_{G}(C) \geq r$ and $|D| \leq|B|$.

If $r_{G}(C)<r$ then, by Lemma 3.3, $m_{2} \geq 8, n_{2} \geq 4, \epsilon=-1, o_{2}<n_{2}, r_{G}(C)_{2}=\frac{m_{2}}{2}=s_{2}$ and $r_{2}=m_{2}$, in contradiction with the second part of condition (Can-). Thus $r_{G}(C) \geq r$.

To prove that $|D| \leq|B|$ we show that $\left|D_{p}\right| \leq\left|B_{p}\right|$ for each prime $p$. This is clear if $p \nmid m$ and a consequence of Lemma 3.1.(4) if $p \in \pi^{\prime}$. Otherwise $p \mid r$. Since both $G_{p}$ and $C_{p} B_{p}$ are Sylow $p$-subgroups of $G$ we may assume that $G_{p}=C_{p} D_{p}$.

Assume first that $\epsilon^{p-1}=1$. Then by assumption $s_{p} \mid n_{p}$. Let $d=b_{p}^{x} a_{p}^{y}$ be a generator of $D_{p}$ and let $R \in \mathbb{N}$ such that $a_{p}^{b_{p}^{x}}=a_{p}^{R}$. The assumption $\epsilon^{p-1}=1$ implies that $R$ satisfies the hypothesis of Lemma 2.1.(1a) and hence $m_{p} \left\lvert\, \mathcal{S}\left(R \left\lvert\, m_{p} \frac{n_{p}}{s_{p}}\right.\right)\right.$ and from (2.1) we deduce that $d^{\frac{m_{p} n_{p}}{s_{p}}}=a_{p}^{y \mathcal{S}\left(\left(1+r_{p}\right)^{x} \left\lvert\, m_{p} \frac{n_{p}}{s_{p}}\right.\right)}=1$ and hence $\left|D_{p}\right| \leq \frac{m_{p} n_{p}}{s_{p}}=\left|b_{p}\right|$. Suppose otherwise that $\epsilon^{p-1}=-1$, i.e. $p=2$ and $\epsilon=-1$. Then $C_{2}^{2}=G_{2}^{\prime}=A_{2}$ and $C_{2} \cap D_{2} \subseteq$ $Z\left(G_{2}\right) \cap C_{2}=Z\left(G_{2}\right) \cap C_{2}^{2}=Z\left(G_{2}\right) A=A^{\frac{m_{2}}{2}}$ and hence $\left|C_{2} \cap D_{2}\right| \leq 2$. Thus $\left|D_{2}\right|=\left[D_{2}\right.$ : $\left.C_{2} \cap D_{2}\right]\left|C_{2} \cap D_{2}\right|=\left[G_{2}: C_{2}\right]\left|C_{2} \cap D_{2}\right| \in\left\{n_{2}, 2 n_{2}\right\}$. Similarly, $\left|B_{2}\right| \in\left\{n_{2}, 2 n_{2}\right\}$. If $\left|B_{2}\right|=2 n_{2}$ then $\left|D_{2}\right|$ divides $\left|B_{2}\right|$ as desired. Suppose otherwise that $\left|B_{2}\right|=n_{2}$. Then $m_{2}=s_{2}$ and hence $m_{2}$ divides $\frac{r_{2} n_{2}}{2}$, by the hypothesis (Can-) and lemma 2.2.(5). If $D_{2} \subseteq\left\langle a, b_{2}^{2}\right\rangle$ then $C_{2}=\left\langle b_{2} a_{2}^{x}\right\rangle$ for some integer $x$ and hence $n_{2}=2$ because $C_{2}^{2}=\left\langle a_{2}^{2}\right\rangle$. Then $D_{2} \subseteq\left\langle a_{2}\right\rangle$ so that $D_{2}$ is normal in $G_{2}$ and hence $\left\langle a_{2}^{2}\right\rangle=C_{2}^{2}=\left[D_{2}, C_{2}\right] \subseteq C_{2} \cap D_{2} \subseteq\left\langle a_{2}^{\frac{m_{2}}{2}}\right\rangle \subseteq\left\langle a_{2}^{2}\right\rangle$. Then $m_{2}=4$ and $G_{2}$ is dihedral of order 8. Then every metacyclic factorization of $G_{2}$ is of the form $\left\langle a_{2}\right\rangle\langle c\rangle$ with $|c|=2$. Thus $\left|D_{2}\right|=2=\left|b_{2}\right|$, as wanted. Assume otherwise that $D_{2} \nsubseteq\left\langle a_{2}, b_{2}^{2}\right\rangle$.

Then $D_{2}=\left\langle b_{2} a_{2}^{x}\right\rangle$ for some integer $x$ and let $R \in \mathbb{N}$ such that $a_{2}^{b_{2}}=a_{2}^{R}$. The hypothesis $\epsilon=-1$ implies that $R$ satisfies the hypothesis of Lemma 2.1.(2a). Since $m_{2}$ divides $\frac{r_{2} n_{2}}{2}$, we get $v_{2}\left(\mathcal{S}\left(R \mid n_{2}\right)\right)=v_{2}\left(r_{2}\right)+v_{2}\left(n_{2}\right)-1 \geq v_{2}\left(m_{2}\right)$ and hence $\left(b_{2} a_{2}^{x}\right)^{n_{2}}=a_{2}^{x \mathcal{S}\left(-1+r_{2} \mid n_{2}\right)}=1$. Then $\left|D_{2}\right|=n_{2}$, as desired. This finishes the proof of Claim 2.

The necessary part in the first statement of the proposition follows from claims 1 and 2.
Claim 3. If $p \mid r, \epsilon^{p-1}=1$ and $s_{p} \nmid n_{p}$ then $\left[G: b a_{p}\right]=s_{p^{\prime}} n_{p}<s$.
First of all $n=\left|b a_{p} A\right|$ and hence $n$ divides $\left|b a_{p}\right|$. Using (2.1) we have $\left(b a_{p}\right)^{n}=a_{p^{\prime}}^{y} a_{p}^{y+\mathcal{S}(t \mid n)}$ and $v_{p}\left(\left[G:\left\langle b a_{p}\right\rangle\right]\right)=v_{p}(\mathcal{S}(t \mid n))=v_{p}(n)<v_{p}(s)=v_{p}(y)$, by Lemma 2.1.(1a) and the assumption. Thus $\left|b a_{p}\right|=n \frac{m}{s_{p^{\prime}} n_{p}}$ and hence $\left[G: b a_{p}\right]=s_{p^{\prime}} n_{p}$. This finishes the proof of Claim 3.

By Claim 3, if the first part of (Can+) fails then $G=A B$ is not minimal because $G=A\left\langle b a_{p}\right\rangle$ is a factorization with $[G: b]>\left[G:\left\langle b a_{p}\right\rangle\right]$. Moreover, the factorization $G=A\left\langle b a_{p}\right\rangle$ satisfies the first part of condition (Can+) and hence after step (4a) of Algorithm 1, the factorization $G=\langle a\rangle\langle b\rangle$ satisfies the first part of (Can+) for the prime $p$.
Claim 4. Suppose that $p\left|r, \epsilon^{p-1}=1, s_{p}\right| n, r_{p} \nmid s$ and $s_{p} o_{p} \mid n$. Let $R \in \mathbb{N}$ with $a_{p}^{b_{p}^{\frac{n}{s_{p}}}}=a^{R}$. Then there is an integer $x$ such that $r-y \equiv x \mathcal{S}\left(R \mid s_{p}\right) \bmod m_{p}$. This justifies the existence of $x$ in step (4) of Algorithm 1. Let $c=b_{p}^{\frac{n}{s_{p}}} a_{p^{\prime}} a_{p}^{x}$ and $C=\langle c\rangle$. Then $G=C B$ is a metacyclic factorization of $G$ with $|C|=m \frac{s_{p}}{r_{p}}<|A|$. Moreover,

$$
\left(r_{G}(C), \epsilon_{G}(C)\right):= \begin{cases}\left(4 r_{2^{\prime}},-1\right), & \text { if } 8 \mid m, s_{p}=2, \text { and } r_{2}=\frac{m_{2}}{2} \\ \left(r_{p^{\prime}} s_{p}, 1\right), & \text { otherwise }\end{cases}
$$

The assumption $s_{p} o_{p} \mid n_{p}$ implies that $o_{p} \left\lvert\, \frac{n}{s_{p}}\right.$ and hence $\left[b_{p}^{\frac{n}{s_{p}}}, a_{\pi^{\prime}}\right]=1$. As also $\left[b_{p}, a_{\pi \backslash\{p\}}\right]=1$ we deduce that $\left[b_{p}^{\frac{n}{s_{p}}}, a_{p^{\prime}}\right]=1$. On the other hand, since $r_{p} \nmid s_{p}, v_{p}(y)=$ $v_{p}(s)<v_{p}(r)$ and therefore $v_{p}(r-y)=v_{p}(s)=v_{p}\left(\mathcal{S}\left(t \mid s_{p}\right)\right)$, by Lemma 2.1.(1a). Therefore there is an integer $x$ coprime with $p$ such that $r-y \equiv x \mathcal{S}\left(R \mid s_{p}\right) \bmod m_{p}$. Using (2.1) we have $c^{s_{p}}=b_{p}^{n} a_{p^{\prime}}^{s_{p}} a_{p}^{x \mathcal{S}\left(R \mid s_{p}\right)}=a_{p^{\prime}}^{s_{p}} a_{p}^{y+x \mathcal{S}\left(R \mid s_{p}\right)}=a_{p^{\prime}}^{s_{p}} a_{p}^{r}$. Then $G^{\prime}{ }_{p^{\prime}} \subseteq\left\langle a_{p^{\prime}}\right\rangle \subseteq C$ and $G^{\prime}{ }_{p}=\left\langle a_{p}^{r}\right\rangle \subseteq C$. Thus $G^{\prime} \subseteq C$ and hence $G=C B$ is a metacyclic factorization of $G$ with $|C|=s_{p}\left|a_{p^{\prime}}\right|\left|a_{p}^{r}\right|=m \frac{s_{p}}{r_{p}}<m=|A|$. As $C_{p^{\prime}}=A_{p^{\prime}}$, we have $r_{G}(C)_{p^{\prime}}=r_{G}(A)_{p^{\prime}}=r_{\pi^{\prime}}$. If $\epsilon_{G}(C)^{p-1}=1$ then $\frac{m_{p}}{r_{p}}=\left|G_{p}^{\prime}\right|=\frac{\left|C_{p}\right|}{r_{G}(C)_{p}}=\frac{m_{p} s_{p}}{r_{p} r_{G}(C)_{p}}$ and hence in this case $r_{G}(C)=r_{p^{\prime}} s_{p}$. Otherwise, i.e. if $p=2$ and $\epsilon_{G}(C)=-1$ then $2\left|C_{2}\right| \leq s_{2} \leq\left|C_{2}\right|$ and $4 \leq r_{G}(C)_{2} \leq\left|C_{2}\right|=$ $\frac{m_{2} s_{2}}{r_{2}}=2\left|G^{\prime}{ }_{2}\right|=\frac{2 m_{2}}{r_{2}}$ and hence $s_{2}=2,\left|C_{2}\right|=4=r_{G}(C)_{2}$ and $r_{2}=\frac{m_{2}}{2}$. Conversely, if $s_{2}=2$ and $r_{2}=\frac{m_{2}}{2}$ then $\left|C_{2}\right|=4$ and hence $r_{G}(C)_{2}=4$. Moreover, as $G_{2}$ is not commutative then $\epsilon_{G}(\stackrel{C}{C})=-1$. This finishes the proof of Claim 4.

Claim 4 shows that if the first part of (Can+) holds but the second one fails then $G=A B$ is not minimal. It furthermore the parameters associated to the factorization $G=C B$, i.e. $|C|,[G: C],[G: B], r_{G}(C), \epsilon_{G}(C), o_{G}(C)$, satisfy condition (Can+) for the prime $p$ and hence, after step (4b) of Algorithm 1, the current factorization $G=\langle a\rangle\langle b\rangle$ satisfies this condition. Moreover, if $\epsilon_{G}(C)=1$ then $r_{p}(C)=s_{p} \leq n_{p}$ and condition (C+) holds for the prime $p$. Thus when the algorithm finishes the loop in step (4), the metacyclic factorization satisfies condition (Can+) and hence the current value of $\langle a\rangle$ is a minimal kernel of $G$ by Claim 1.

Observe that the modification of $a$ and $b$ in steps (4a) and (4b) for some prime $p$ does not affect the subsequent calculations inside the loop. Indeed, suppose that $p$ and $q$ are two different divisors of $r$ with $\epsilon^{p-1}=\epsilon^{q-1}=1$, and the prime $p$ has been considered before the prime $q$ in step (4). This has affected $a$ and $b$ which have been transformed by first transforming $b$ into $d=b a_{p}$ and then transforming $a$ into $c=d_{p} a_{p^{\prime}} a_{p}^{x}=b_{p} a_{p^{\prime}} a_{p}^{1+x}$. In principal we should recalculate the natural number $y$ computed in step (2) to a new $y^{\prime}$. However, as $p \in \pi,\left[b_{p^{\prime}}, a_{p}\right]=\left[b_{q^{\prime}}, a_{p}\right]=1$ and hence $a_{p^{\prime}}=c_{p^{\prime}}$ and $b_{p^{\prime}}=d_{p^{\prime}}$. Therefore $d_{q}=c_{q}^{y}$ and hence $y^{\prime} \equiv y \bmod m_{q}$. Therefore when in step (4b) for the prime $q$ we compute $x$ satisfying if $r-y \equiv x \mathcal{S}\left(R \mid s_{q}\right) \equiv \bmod m_{q}$ we also have $r-y^{\prime} \equiv x \mathcal{S}\left(R \mid s_{q}\right) \bmod m_{q}$.

By Lemma 3.3, if the second part of condition (Can-) is satisfied then $r_{G}(A)=r_{G}$. Otherwise, $r_{G}(A)>r_{G}$, and hence the factorization $G=A B$ is not minimal, However, after step (5) the factorization $G=\langle a\rangle\langle b\rangle$ satisfy both $|a|=m_{G}$ and $r_{G}(\langle a\rangle)=r_{G}$. In the remainder of the algorithm the kernel $\langle a\rangle$ is not modified and hence this is going to be valid in the remainder of the algorithm.

Finally suppose that the first part of (Can-) fails, so that $p=2, \epsilon=-1$ and $s_{2}=$ $r_{2} n_{2}$. Then $4 \mid r$ and $\langle t\rangle_{m_{2}}=\left\langle-1+r_{2}\right\rangle_{m_{2}}$. Moreover, by Lemma 2.2.(5), we have that $s_{2} \in\left\{\frac{m_{2}}{2}, m_{2}\right\}$ and $m_{2} \mid r_{2} n_{2}$. Therefore $s_{2}=m_{2}=r_{2} n_{2}$. Then $v_{2}\left(\mathcal{S}\left(t \mid n_{2}\right)\right)=v_{2}(r)+$ $v_{2}(n)-1=v_{2}(m)-1$, by Lemma 2.1.(2a). As in the proof of Claim 3, we use the metacyclic factorization of $G=A\left\langle b a_{2}\right\rangle$. If $G=A B$ is minimal then we have $n\left|\left(b a_{2}\right)^{n}\right|=\left|b a_{2}\right| \leq$ $|b|=n\left|a^{s}\right|=n \frac{m}{s}$. Therefore $\left|\left(b a_{2}\right)^{n}\right| \leq \frac{m}{s}$. Using (2.1) once more and $\left[b_{2^{\prime}}, a_{2}\right]=1$, we obtain $\left(b a_{2}\right)^{n}=a^{y} a_{2}^{\mathcal{S}\left(t \mid n_{2}\right)}=a_{2}^{y} a_{2}^{\frac{m_{2}}{2}}$. Thus $\left|\left(b a_{2}\right)^{n}\right|=2 \frac{m}{s}$ and hence $\left|b a_{2}\right|=2 \frac{m s}{s}=2|B|$, contradicting the minimality. Thus $G=A B$ is not minimal. Moreover, the new metacyclic factorization satisfies (Can-) because, $\left|b a_{2}\right|_{2}=2|b|_{2}$ and hence if $s^{\prime}=\left[G:\left\langle b a_{2}\right\rangle\right]$ then $s_{2}^{\prime}=\frac{m_{2}}{2} \neq m_{2}=r_{2} n_{2}$.

In order to prove that the last entry of $\operatorname{MCINV}(G)$ is well defined and prove Theorem A we need one more lemma which is inspired in Lemmas 5.5 and 5.7 of [5].

Lemma 3.5. Let $p$ be a prime and consider the group $P=\mathcal{G}_{m, n, s, \epsilon+r}$ with $m$ and $n$ powers of $p, r$ and $s$ divisors of $m$ and $\epsilon \in\{1,-1\}$ satisfying the following conditions: $p|r, m| r n$, if $4 \mid m$ then $4 \mid r$, if $\epsilon=1$ then $m \mid r s$ and if $\epsilon=-1$ then $2|n, 4| m$ and $m \mid 2 s$. Let o be $a$ divisor of $n$ and $N=\left\langle a, b^{\circ}\right\rangle$. Denote
$w= \begin{cases}\min \left(o, \frac{m}{r}, \max \left(1, \frac{s}{r}, \frac{s o}{n}\right)\right), & \text { if } \epsilon=1 ; \\ 1, & \text { if } \epsilon=-1 \text { and }, o \mid 2 \text { or } m \mid 2 r ; \\ \frac{m}{2 r}, & \text { if } \epsilon=-1,4|o<n, 4 r| m, \text { and if } s \neq n r \text { then } 2 s=m<n r ; \\ \frac{m}{r}, & \text { otherwise. }\end{cases}$
If $y$ is an integer coprime with $p$ then the following conditions are equivalent:

1. There are $c \in N$ and $d \in b^{y} N$ such that $P=\langle c, d\rangle,|c|=m, d^{n}=c^{s}$ and $c^{d}=c^{\epsilon+r}$.
2. $y \equiv 1 \bmod w$.

Proof. Observe that $N$ is the unique subgroup of $G$ of index $o$ containing $a$. We will make a wide use of (2.1) and Lemma 2.1, sometimes without specific mention. We consider separately the cases $\epsilon=1$ and $\epsilon=-1$.

Case 1. Suppose $\epsilon=1$.
(1) implies (2). Suppose that $c$ and $d$ satisfy the conditions of (1). If $w=1$ then obviously (2) holds. So we may assume that $w \neq 1$ and in particular $p \mid o$ and $p r \mid m$. The first implies that $N \subseteq\left\langle a, b^{p}\right\rangle$ and the second that $P /\left\langle a^{p}, b^{p}\right\rangle$ is not cyclic. Therefore $c \notin\left\langle a^{p}, b^{p}\right\rangle$ and hence $\langle c\rangle=\left\langle b^{x v} a\right\rangle$ with $o|v| n$ and $p \nmid x$. Write $d=b^{y_{1}} a^{z}$ with $y_{1}, z \in \mathbb{Z}$. From the assumption $d \in b^{y} N$ we have that $y_{1} \equiv y \bmod o$ and hence $y \equiv y_{1} \bmod w$. Therefore, it suffices to prove that $y_{1} \equiv 1 \bmod w$. From $c^{d}=c^{1+r}$ we have

$$
b^{x v} a^{z\left(1-(1+r)^{x v}\right)+(1+r)^{y_{1}}}=\left(b^{x v} a\right)^{b^{y_{1}} a^{z}}=\left(b^{x v} a\right)^{1+r}=b^{x v} a b^{x v r} a^{\mathcal{S}\left((1+r)^{x v} \mid r\right)} .
$$

Then $n \mid v r$ and $b^{x v r}=a^{x s \frac{v r}{n}}$. Thus

$$
z\left(1-(1+r)^{x v}\right)+(1+r)^{y_{1}}-1 \equiv x s \frac{v r}{n}+\mathcal{S}\left((1+r)^{x v} \mid r\right) \quad \bmod m
$$

This implies that that $r$ divides $x s \frac{v r}{n}$, since $r$ divides $m$. As $r$ is coprime with $x$, it follows that $n$ divides $s v$. Moreover, $(1+r)^{x v} \equiv 1 \bmod r v$, by Lemma 2.1.(1a), and hence $\mathcal{S}\left((1+r)^{x v} \mid r\right) \equiv r \bmod r v$. As $r, v, m$ and $s$ are powers of $p$ we deduce that

$$
(1+r)^{y_{1}} \equiv 1+r \quad \bmod \min \left(m, r v, \frac{s v r}{n}\right)
$$

Using Lemma 2.1.(1b) it follows that $y_{1} \equiv 1 \bmod \min \left(\frac{m}{r}, v, \frac{s v}{n}\right)$.
Suppose that $y_{1} \not \equiv 1 \bmod w$. Then

$$
\min \left(\frac{m}{r}, o, \frac{s o}{n}\right) \leq \min \left(\frac{m}{r}, v, \frac{s v}{n}\right)<w=\min \left(\frac{m}{r}, o, \max \left(1, \frac{s}{r}, \frac{s o}{n}\right)\right)
$$

and hence $\frac{s}{r}>\left(1, \frac{s o}{n}\right)$ and $\frac{m}{r} \geq w=\min \left(o, \frac{s}{r}\right)>\min \left(\frac{m}{r}, v, \frac{s v}{n}\right)$. Thus

$$
\frac{s}{r} \geq w=\min \left(o, \frac{s}{r}\right)>\min \left(v, \frac{s v}{n}\right) \geq \min \left(o, \frac{s o}{n}\right)
$$

Since $n \mid v r$ it follows that $\min \left(v, \frac{s v}{n}\right)<\frac{s}{r} \leq \frac{s v}{n}$ and hence $o \leq v=\min \left(v, \frac{v s}{n}\right)<\min \left(o, \frac{s}{r}\right)$, a contradiction.
(2) implies (1). We now suppose that $y \equiv 1 \bmod w$ and we have to show that there is $c \in N$ and $d \in b^{y} N$ satisfying the conditions in (1). If $y \equiv 1 \bmod o$ then $b N=b^{y} N$ and hence $c=a$ and $d=b$ satisfy the desired condition. If $(1+r)^{y} \equiv 1+r \bmod m$ then $a^{b^{y}}=a^{1+r}$ and hence $c=a^{y}$ and $b^{y}$ satisfy the desired conditions. So we suppose that $y \not \equiv 1 \bmod o$ and $(1+r)^{y} \not \equiv 1+r \bmod m$. The first implies that $w<o$ and the second that $y-1$ is not multiple of $o_{m}(1+r)=\frac{m}{r}$, by Lemma 2.1.(1b) and hence $w<\frac{m}{r}$. Thus $w=\max \left(1, \frac{s}{r}, \frac{o s}{n}\right)<\min \left(o, \frac{m}{r}\right)$.

By Lemma 2.1.(1b) we have $(1+r)^{y}=1+r(1+x u)$ with $p \nmid x, u$ a power of $p$ and $v_{p}(w) \leq v_{p}(u)=v_{p}(y-1)<v_{p}\left(\frac{m}{r}\right) \leq v_{p}(s)$. Moreover, if $u=1$ then $p \nmid 1+x$. Let $c_{1}=b^{x \frac{n u}{s}} a$. We now prove that $\left|c_{1}\right|=m$. Observe that $\frac{n u}{s} \geq \frac{n w}{s} \geq o$. Therefore $c_{1} \in N$. Moreover, as $v_{p}(u)<v_{p}(s)$ it follows that $\left|c_{1}\langle a\rangle\right|=\frac{s}{u}$ and $\left.c_{1}^{\frac{s}{u}}=a^{x s+\mathcal{S}\left(\left.(1+r)^{x \frac{n u}{s}} \right\rvert\, \frac{s}{u}\right.}\right)$. If $u \neq 1$ then $v_{p}(r) \geq v_{p}\left(\frac{s}{w}\right) \geq v_{p}\left(\frac{s}{u}\right)=v_{p}\left(\mathcal{S}\left(\left.(1+r)^{x \frac{n u}{s}} \right\rvert\, \frac{s}{u}\right)\right)=v_{p}\left(x s+\mathcal{S}\left(\left.(1+r)^{x \frac{n u}{s}} \right\rvert\, \frac{s}{u}\right)\right)$ and therefore $G^{\prime}=\left\langle a^{r}\right\rangle \subseteq\left\langle c_{1}\right\rangle$ and $\left|c_{1}\right|=m$, as desired. Otherwise, i.e. if $u=1$ then $w=1$ and hence $s \leq r$ and $p|\bar{o}| \frac{n}{s}$. Then $x s+\mathcal{S}\left(\left.(1+r)^{x \frac{n u}{s}} \right\rvert\, s\right) \equiv s(x+1) \not \equiv 0 \bmod p r$ because
$s \leq r$ and $p \nmid x+1$. Therefore also in this case $v_{p}(r) \leq v_{p}\left(x s+\mathcal{S}\left(\left.(1+r)^{x \frac{n u}{s}} \right\rvert\, s\right)\right)$ and hence $G^{\prime} \subseteq\left\langle c_{1}\right\rangle$ and $\left|c_{1}\right|=m$, as desired.

Since $(1+r)^{x \frac{n u}{s}} \equiv 1 \bmod r \frac{n u}{s}$ we have $\mathcal{S}\left(\left.(1+r)^{x \frac{n u}{s}} \right\rvert\, r\right) \equiv r \bmod r \frac{n u}{s}$. Therefore $(1+r)^{y}-1-x r u-\mathcal{S}\left(\left.(1+r)^{x \frac{n u}{s}}\right|_{r} ^{s}\right) \equiv 0 \bmod \frac{r n u}{s}$. Moreover, $v_{p}\left(1-(1+r)^{x \frac{n u}{s}}\right)=v_{p}\left(r \frac{n u}{s}\right)$, and hence there is an integer $z$ satisfying

$$
z\left(1-(1+r)^{x \frac{n u}{s}}\right)+(1+r)^{y} \equiv 1+x r u+\mathcal{S}\left((1+r)^{x u} \mid r\right) \quad \bmod m .
$$

Let $d=b^{y} a^{z} \in b^{y} N$. Using that $u \geq w \geq \frac{s}{r}$ we have

$$
c_{1}^{d}=\left(b^{x \frac{n u}{s}} a\right)^{b^{y} a^{z}}=b^{x \frac{n u}{s}} a^{z\left(1-(1+r)^{x \frac{n u}{s}}\right)+(1+r)^{y}}=b^{x \frac{n u}{s}} a^{1+x r u+\mathcal{S}\left(\left.(1+r)^{\frac{x u}{s}} \right\rvert\, r\right)}=c_{1}^{1+r},
$$

On the other hand

$$
d^{n}=\left(b^{y} a^{z}\right)^{n}=a^{s y+z \mathcal{S}\left((1+r)^{y} \mid n\right)}
$$

and

$$
\left.c_{1}^{s}=\left(b^{x \frac{n u}{s}} a\right)^{s}=a^{x u s+\mathcal{S}\left(\left.(1+r)^{x \frac{n u}{s}} \right\rvert\, s\right.}\right) .
$$

if $s \geq n$ then $o>w=\max \left(\frac{s o}{n}, \frac{s}{r}\right) \geq \frac{s o}{n} \geq o$, a contradiction. Therefore, $s$ is a proper divisor of $n$ and hence $v_{p}\left(s y+z \mathcal{S}\left((1+r)^{y} \mid n\right)\right)=s$. Then $d^{n}$ and $c_{1}^{s}$ are elements of $\langle a\rangle$ of the same order. Therefore $b^{n}=c^{k s}$ for some integer $k$ coprime with $p$. Then $c=c_{1}^{k}$ and $d$ satisfy the conditions of (1).

Case 2. Suppose that $\epsilon=-1$.
(1) implies (2). Suppose that $c$ and $d=b^{y} a^{z}$ satisfy the conditions of (1). Then $4 \mid r$ and $G^{\prime}=\left\langle a^{2}\right\rangle=\left\langle c^{2}\right\rangle$. As in Case 1 we may assume that $w \neq 1$. Then both $o$ and $\frac{m}{r}$ are multiple of 4 and we must prove, on the one hand that $y \equiv 1 \bmod \frac{m}{2 r}$ and, on the other hand that $y \equiv 1 \bmod \frac{m}{r}$, if one of the following conditions hold: $o=n$ or, $s=m \neq n r$, or $2 s=m=n r$. From $4 \mid o$ and $G /\langle c\rangle$ being cyclic we deduce $\langle c\rangle=\left\langle b^{x v} a\right\rangle$ with $o|v| n$ and $2 \nmid x$. From $G^{\prime}=\left\langle a^{2}\right\rangle=\left\langle c^{2}\right\rangle$ it follows that $\left.\frac{n}{2} \right\rvert\, v$ so that $v$ is either $n$ or $\frac{n}{2}$. If $v=n$ then $\langle c\rangle=\langle a\rangle$. Therefore $a^{-1+r}=a^{d}=a^{(-1+r)^{y}}$ and hence $(-1+r)^{y-1} \equiv 1 \bmod 2^{m}$. Then $y \equiv 1 \bmod \frac{m}{r}$ by Lemma 2.1.(2b). This proves the result if $o=n$ because in that case $v$ is necessarily $n$.

Suppose otherwise that $v=\frac{n}{2}$. Then we distinguish the cases $m<n r$ and $m=n r$.
Assume that $m<n r$. Then, as $4|o| v$ we have $o_{m}(-1+r)=\max \left(2, \frac{m}{r}\right) \leq \frac{n}{2}=v$ and hence $b^{v}$ is central in $G$. Then, having in mind that $4 \mid r$ and $m \mid 2 s$, we have

$$
b^{x v} a^{(-1+r)^{y}}=\left(b^{x v} a\right)^{b^{y} a^{z}}=\left(b^{x v} a\right)^{-1+r}=b^{x v} a\left(b^{x v} a\right)^{r-2}=b^{x v} a^{r-1+x s\left(\frac{r}{2}-1\right)}=b^{x v} a^{-1+s+r} .
$$

Therefore $(-1+r)^{y} \equiv-1+r+s \bmod m$ and in particular $(-1+r)^{y} \equiv-1+r \bmod s$, since $s \mid m$. Using Lemma 2.1 once more we deduce that $y \equiv 1 \bmod \frac{m}{2 r}$ and if $s=m$ then $y \equiv 1$ $\bmod \frac{m}{r}$.

Suppose otherwise that $m=n r$. Then, from Lemma 2.1.(2a) we have $v_{2}\left((-1+r)^{v}-1\right)=$ $v_{2}(r)+v_{2}(v)=v_{2}(r)+v_{2}(n)-1=v_{2}\left(\frac{m}{2}\right)$ so that $a^{b^{v}}=a^{1+\frac{m}{2}}$ and $\left(b^{x v} a\right)^{2}=a^{2+s+\frac{m}{2}}$ and hence $\left(b^{x v} a\right)^{4}=a^{4}$. As $4 \mid o$ it follows that $\left(b^{x v} a\right)^{n}=a^{n}$. On the other hand, as $y$ is odd, it follows that $v_{2}\left((-1+r)^{y}+1\right)=v_{2}(r) \geq 2$, by Lemma 2.1.(2c). Therefore, $v_{2}\left(\mathcal{S}\left((-1+r)^{y} \mid n\right)\right)=v_{2}(r n)-1=v_{2}(m)-1$, by Lemma 2.1.(2a). Then $\mathcal{S}\left((-1+r)^{y} \mid n\right) \equiv$ $\frac{m}{2} \bmod m$ an hence, having in mind that $8\left|\frac{m}{2}\right| s$ we deduce that $a^{s}=c^{s}=d^{n}=$
$a^{y s+z \mathcal{S}\left((-1+r)^{y} \mid n\right)}=a^{s+z \frac{m}{2}}$. Therefore $z$ is even. On the other hand from $c^{d}=c^{-1+r}$ and having in mind that $(-1+r)^{v}-1 \equiv \frac{m}{2} \bmod m$ and $z$ is even, we obtain

$$
\begin{gathered}
b^{x v} a^{(-1+r)^{y}}=\left(b^{x v} a\right)^{b^{y} a^{z}}=\left(b^{x v} a\right)^{-1+r}= \\
=b^{x v} a\left(b^{x v} a\right)^{r-2}=b^{x v} a\left(a^{x s+2+\frac{m}{2}}\right)^{\frac{r}{2}-1}=b^{x v} a^{-1+s+r+\frac{m}{2}} .
\end{gathered}
$$

Therefore $(-1+r)^{y} \equiv-1+r+s+\frac{m}{2} \bmod m$. Again, from $m \mid 2 s$ and Lemma 2.1.(2b) we deduce that $y \equiv 1 \bmod \frac{m}{2 r}$ and if $s=\frac{m}{2}$ then $y \equiv 1 \bmod \frac{m}{r}$.
(2) implies (1). Suppose that $y \equiv 1^{2} \bmod w$. As $y$ is odd, if $o \mid 2$ then $b \in b^{y} N$ and hence $a$ and $b$ satisfy condition (1). So we assume from now on that $4 \mid o$. In particular $4 \mid n$. Suppose that $m \mid 2 r$, i.e. $r$ is either $m$ or $\frac{m}{2}$ and let $c=a^{y}$ and $d=b^{y} a^{2}$. In this case $b^{2}$ is central in $P$ and hence $c^{d}=c^{b}=c^{-1+r}$ and applying statements (2a) and (2c) of Lemma 2.1 we obtain $d^{n}=a^{y s+\mathcal{S}\left((-1+r)^{y} \mid n\right)}=a^{y s}=c^{s}$. Hence $c$ and $d$ satisfy the conditions of (1).

Thus from now on we assume that 4 divides both $o$ and $\frac{m}{r}$. Suppose that $y \equiv 1 \bmod \frac{m}{r}$. Then $a^{b^{y}}=a^{b}=a^{-1+r}$ because $b^{\frac{m}{r}}$ is central in $P$. Moreover, as $m \mid 2 s$ and $y$ is odd we have $\left(b^{y}\right)^{n}=a^{s y}=a^{s}$. Therefore $c=a$ and $d=b^{y}$ satisfy condition (1) and this finishes the proof of the lemma if $w=\frac{m}{r}$ and it also proves that for $w=\frac{m}{2 r}$ we may assume that $y \not \equiv 1$ $\bmod \frac{m}{r}$. So suppose that $w=\frac{m}{2 r}$ and $y \not \equiv 1 \bmod \frac{m}{r}$. Then $y \equiv 1+\frac{m}{2 r} \bmod \frac{m}{r}, o<n$ and either $m=s=n r$ or $2 s=m<n r$. Let $c=b^{\frac{n}{2}} a$ and $d=b^{y}$. Then, in both cases, $c^{2}=a^{2+\frac{m}{2}}$ and, as $\frac{m}{2}$ is multiple of 4 we have that $G^{\prime}=\left\langle a^{2}\right\rangle=\left\langle c^{2}\right\rangle,|c|=m$ and $c^{s}=a^{s}$. Moreover,

$$
\begin{gathered}
c^{-1+r}=\left(b^{\frac{n}{2}} a\right)^{-1+r}=b^{\frac{n}{2}} a\left(b^{\frac{n}{2}} a\right)^{r-2}=b^{\frac{n}{2}} a a^{\left(2+\frac{m}{2}\right)\left(\frac{r}{2}-1\right)}= \\
=b^{\frac{n}{2}} a^{-1+r+\frac{m}{2}}=b^{\frac{n}{2}} a^{(-1+r)\left(1+\frac{m}{2}\right)}=\left(b^{\frac{n}{2}} a\right)^{b^{1+\frac{m}{2 r}}}=c^{d}
\end{gathered}
$$

and

$$
d^{n}=a^{s\left(1+\frac{m}{2 r}\right)}=a^{s}=c^{s}
$$

Then $c$ and $d$ satisfy the conditions of (1).

Theorem 3.6. Let $m, n, s \in \mathbb{N}$ with $s \mid m$ and let $T$ and $\bar{T}$ be ( $n, s)$-canonical cyclic subgroups of $\mathcal{U}_{m}$. Set $[r, \epsilon, o]=[T],[\bar{r}, \bar{\epsilon}, \bar{o}]=[\bar{T}], \pi=\pi(r) \cup(\pi(n) \backslash \pi(m)), \bar{\pi}=\pi(\bar{r}) \cup(\pi(n) \backslash \pi(m))$, $m^{\prime}=[T, n, s]$ and $\bar{m}^{\prime}=[\bar{T}, n, s]$.

Then the following statements are equivalent.

1. $\mathcal{G}_{m, n, s, T}$ and $\mathcal{G}_{m, n, s, \bar{T}}$ are isomorphic.
2. $\operatorname{Res}_{m^{\prime}}(T)=\operatorname{Res}_{\bar{m}^{\prime}}(\bar{T})$.
3. $\pi=\bar{\pi}, \operatorname{Res}_{m_{\pi^{\prime}}}\left(T_{\pi^{\prime}}\right)=\operatorname{Res}_{m_{\pi^{\prime}}}\left(\bar{T}_{\pi^{\prime}}\right)$ and $\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(T_{p}\right)=\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(\bar{T}_{p}\right)$ for every $p \in \pi$.

Proof. Let $G=\mathcal{G}_{m, n, s, T}$ and $\bar{G}=\mathcal{G}_{m, n, s, \bar{T}}$. To distinguish the generators $a$ and $b$ in the presentation of $G$ and $\bar{G}$ we denote the latter by $\bar{a}$ and $\bar{b}$. We also denote $A=\langle a\rangle, B=\langle b\rangle$, $\bar{A}=\langle\bar{a}\rangle$ and $\bar{B}=\langle\bar{b}\rangle$. The hypothesis warrants that $G=A B$ and $\bar{G}=\bar{A} \bar{B}$ are minimal metacyclic factorizations by Proposition 3.4. In particular, $|A|=|\bar{A}|=m=m_{G}=m_{\bar{G}}$, $[G: A]=[\bar{G}: \bar{A}]=n=n_{G}=n_{\bar{G}},[G: B]=[\bar{G}: \bar{B}]=s=s_{G}=s_{\bar{G}}, T=T_{G}(A)$ and $\bar{T}=T_{\bar{G}}(\bar{A})$.
(2) implies (3) Suppose that statement (2) holds. Then, using that $\pi(m)=\pi\left(m^{\prime}\right)=$ $\pi\left(\bar{m}^{\prime}\right)$, we have $\operatorname{Res}_{p}(T)=\operatorname{Res}_{p}\left(\operatorname{Res}_{m^{\prime}}(T)\right)=\operatorname{Res}_{p}\left(\operatorname{Res}_{m^{\prime}}(\bar{T})\right)=\operatorname{Res}_{p}(\bar{T})$ for every prime $p$ dividing $m$. Thus, $\pi^{\prime}=\bar{\pi}^{\prime}$ and, as $m_{\pi^{\prime}}=m_{\pi}^{\prime}$, we have

$$
\operatorname{Res}_{m_{\pi^{\prime}}}\left(T_{\pi^{\prime}}\right)=\operatorname{Res}_{m_{\pi^{\prime}}^{\prime}}(T)_{\pi}=\operatorname{Res}_{m_{\pi^{\prime}}^{\prime}}(\bar{T})_{\pi}=\operatorname{Res}_{m_{\pi^{\prime}}}\left(\bar{T}_{\pi^{\prime}}\right)
$$

and

$$
\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(T_{p}\right)=\operatorname{Res}_{m_{\pi^{\prime} \cup\{p\}}^{\prime}}(T)_{p}=\operatorname{Res}_{m_{\pi^{\prime} \cup\{p\}}^{\prime}}(\bar{T})_{p}=\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(\bar{T}_{p}\right)
$$

for every $p \in \pi(m) \backslash \pi^{\prime}$.
(1) implies (2). Suppose that $G \cong \bar{G}$. Then, as $T$ and $\bar{T}$ are $(n, s)$-canonical they yield the same parameters, i.e. $\pi^{\prime}=\bar{\pi}^{\prime}, o=\bar{o}$, etc.

Let $f: \bar{G} \rightarrow G$ be an isomorphism and let $c=f(\bar{a}), d=f(\bar{b}), C=\langle c\rangle$ and $D=\langle d\rangle$. Then $C_{\pi^{\prime}}=f\left(\bar{G}^{\prime} \pi_{\bar{\prime}}\right)=G_{\pi^{\prime}}^{\prime}=A_{\pi^{\prime}}$, by Lemma 3.1.(3). Furthermore, $C_{\pi^{\prime}} D_{\pi^{\prime}}=A_{\pi^{\prime}} B_{\pi^{\prime}}$ because $A B$ and $\bar{A} \bar{B}$ are the unique Hall $\pi^{\prime}$-subgroup of $G$ and $\bar{G}$, respectively. Then $\operatorname{Res}_{m_{\pi^{\prime}}}(T)=T_{G}\left(A_{\pi^{\prime}}\right)=T_{G}\left(C_{\pi^{\prime}}\right)=\operatorname{Res}_{m_{\pi^{\prime}}}(\bar{T}) . \quad$ As $\operatorname{Res}_{m_{\pi}}\left(T_{\pi^{\prime}}\right)=\operatorname{Res}_{m_{\pi}}\left(\bar{T}_{\pi^{\prime}}\right)=1$ it follows that $\operatorname{Res}_{m^{\prime}}\left(T_{\pi^{\prime}}\right)=\operatorname{Res}_{m^{\prime}}\left(\bar{T}_{\pi^{\prime}}\right)$. Since $T$ and $\bar{T}$ are cyclic, it remains to prove that $\operatorname{Res}_{m^{\prime}}\left(T_{p}\right)=\operatorname{Res}_{m^{\prime}}\left(\overline{T_{p}}\right)$ for every $p \in \pi$. Moreover, as $G$ and $\bar{G}$ have the same parameters $\epsilon$ and $r$ we have $\operatorname{Res}_{m_{p}}\left(T_{p}\right)=\operatorname{Res}_{m_{p}}\left(\bar{T}_{p}\right)=\left\langle\epsilon^{p-1}+r_{p}\right\rangle_{m_{p}}$. Denote $R=\epsilon^{p-1}+r_{p}$ and select generators $t$ of $\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(T_{p}\right)$ and $\bar{t}$ of $\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(T_{p}\right)$ such that $\operatorname{Res}_{m_{p}}(t)=\operatorname{Res}_{m_{p}}(\bar{t})[R]_{m_{p}}$. We already know that $\operatorname{Res}_{m_{\pi^{\prime}}^{\prime}}(T)=\operatorname{Res}_{m_{\pi^{\prime}}^{\prime}}(\bar{T})$ and in particular, there is an integer $x$ coprime with $p$ such that $\bar{t} \xlongequal{=} t^{x} \bmod m_{\pi^{\prime}}$. ${ }^{\prime}$ If $o_{p} \leq 2$ then $\operatorname{Res}_{m_{\pi^{\prime}}^{\prime}}(t)=\operatorname{Res}_{m_{\pi^{\prime}}^{\prime}}(\bar{t})$ and if $o_{m_{p}^{\prime}}(R) \leq 2$ then $\operatorname{Res}_{m_{p}^{\prime}}\left(t^{x}\right)=\left[R^{x}\right]_{m_{p}^{\prime}}=[R]_{m_{p}}=\operatorname{Res}_{m_{p}^{\prime}}(t)$. In both cases $\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}(T)=$ $\langle t\rangle=\left\langle t^{x}\right\rangle=\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}(\bar{T})$, as desired. Therefore, in the remainder we may assume that both $o_{p}$ and $o_{m_{p}^{\prime}}(R)$ are greater than 2 and, in particular, $o_{m_{p}^{\prime}}(R)=\frac{m_{p}^{\prime}}{r_{p}}=\operatorname{Res}_{m_{p}^{\prime}}(T)$ and this number coincides with the $w$ in Lemma 3.5.

On the other hand $A_{p} B_{p}$ and $f\left(\bar{A}_{p} \bar{B}_{p}\right)=C_{p} D_{p}$ are Sylow $p$-subgroup of $G$ and hence they are conjugate in $G$. Composing $f$ with an inner automorphism of $G$ we may assume that $C_{p} D_{p}=A_{p} B_{p}$. Then $\left\langle c, d^{o_{p}}\right\rangle=f\left(\left\langle\bar{a}, \bar{b}^{o_{p}}\right\rangle\right)=f\left(C_{\bar{G}_{p}}\left(\bar{G}_{\pi^{\prime}}{ }^{\prime}\right)\right)=C_{G_{p}}\left(G_{\pi^{\prime}}^{\prime}\right)=\left\langle a, b^{o_{p}}\right\rangle$. By Lemma 3.5 we have $d=b^{y} g$ for some $g \in C_{G_{p}}\left(G_{\pi^{\prime}}^{\prime}\right)$ and $y \equiv 1 \bmod w$. Thus $\operatorname{Res}_{m_{\pi^{\prime}}}(\bar{t})=$ $\operatorname{Res}_{m_{\pi^{\prime}}}\left(t^{y}\right)$ and $\operatorname{Res}_{m_{p}^{\prime}}(\bar{t})=\operatorname{Res}_{m_{p}^{\prime}}(t)=\operatorname{Res}_{m_{p}^{\prime}}(R)=\operatorname{Res}_{m_{p}^{\prime}}\left(R^{y}\right)=\operatorname{Res}_{m_{p}^{\prime}}\left(t^{y}\right)$, because $y \equiv 1 \bmod o_{m_{p}^{\prime}}(R)$. Thus $\operatorname{Res}_{m_{\pi}^{\prime}, m_{p}^{\prime}}\left(\bar{T}_{p}\right)=\operatorname{Res}_{m_{\pi^{\prime}}^{\prime} m_{p}^{\prime}}(\bar{t})=\operatorname{Res}_{m_{\pi^{\prime}}^{\prime}, m_{p}^{\prime}}\left(t^{y}\right)=\operatorname{Res}_{m_{\pi}^{\prime}, m_{p}^{\prime}}\left(T_{p}\right)$, as desired.
(3) implies (1) Suppose that the conditions of (3) holds. We may assume that $a=\bar{a}$ and take generators $t$ of $T$ and $\bar{t}$ of $\bar{T}$ so that $G=\langle a, b\rangle, \bar{G}=\langle a, \bar{b}\rangle$, with $|a|=m,[G:\langle a\rangle]=n$, $b^{n}=a^{s}, a^{b}=a^{t}, a^{\bar{b}}=a^{\bar{t}}$. Moreover, from the assumption we may assume $a^{b_{\pi^{\prime}}}=a^{\bar{b}_{\pi^{\prime}}}$ and for every $p \in \pi$ we have $\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(T_{p}\right)=\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(\bar{T}_{p}\right)$. In particular, for every $p \in \pi$, we have $\left\langle\epsilon^{p-1}+r_{p}\right\rangle_{m_{p}^{\prime}}=\operatorname{Res}_{m_{p}^{\prime}}\left(T_{p}\right)=\operatorname{Res}_{m_{p}^{\prime}}\left(\bar{T}_{p}\right)=\left\langle\bar{\epsilon}^{p-1}+\bar{r}_{p}\right\rangle$. Since $r_{p}\left|m_{p}^{\prime}\right| m_{p}$ it follows that $\epsilon=\bar{\epsilon}$ and $r_{p}=\bar{r}_{p}$. Thus $r=\bar{r}$.

We claim that for every $p \in \pi$ we can rewrite $G_{p}=\left\langle a_{p}, b_{p}\right\rangle$ as $G_{p}=\left\langle c_{p}, d_{p}\right\rangle$ with $c_{p} \in\left\langle a_{p}, b_{p}^{o_{p}}\right\rangle=C_{G_{p}}\left(a_{\pi^{\prime}}\right)$ and $d_{p} \in b^{y} C_{G_{p}}\left(a_{\pi^{\prime}}\right)$ such that $\left|c_{p}\right|=m_{p}, c_{p}^{d_{p}}=c_{p}^{R_{p}}, a_{\pi^{\prime}}^{d_{p}}=a_{\pi^{\prime}}^{\bar{b}_{p}}$ and $d_{p}^{n_{p}}=c_{p}^{s_{p}}$.

Indeed, let $p \in \pi$. The assumption $\left\langle\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(t_{p}\right)\right\rangle=\left\langle\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(\bar{t}_{p}\right)\right\rangle$ implies that there is an integer $y$ coprime with $\left|\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(t_{p}\right)\right|$ such that $\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(\bar{t}_{p}\right)=\operatorname{Res}_{m_{\pi^{\prime}} m_{p}^{\prime}}\left(t_{p}\right)^{y}$. If
$o_{p} \leq 2$ or $o_{m_{p}}(R) \leq 2$ then, as in the proof of (1) implies (2) we have that $\operatorname{Res}_{m_{\pi^{\prime}} m_{p}}(t)=$ $\operatorname{Res}_{m_{\pi^{\prime}} m_{p}}(\bar{t})$ so that $c_{p}=a_{p}$ and $d_{p}=b_{p}$ satisfies the desired conditions. So assume that $o_{p}>2$ and $o_{m_{p}}(R)>2$. From the equality $a_{p}^{b_{p}}=a_{p}^{\bar{b}_{p}}$ we deduce that $R^{y} \equiv R \bmod m_{p}^{\prime}$ and this implies that $y \equiv 1 \bmod w$ where $w=o_{m_{p}^{\prime}}(R)=\frac{m_{p}^{\prime}}{r_{p}}$ and again this $w$ coincides with the one in Lemma 3.5. Applying Lemma 3.5 we deduce that $\left\langle a_{p}, b_{p}\right\rangle$ contain elements $c_{p} \in\left\langle a_{p}, b_{p}^{o}\right\rangle=C_{G_{p}}\left(a_{\pi^{\prime}}\right)$ and $d_{p} \in b^{y} C_{G_{p}}\left(a_{\pi^{\prime}}\right)$ such that $\left\langle a_{p}, b_{p}\right\rangle=\left\langle c_{p}, d_{p}\right\rangle,\left|c_{p}\right|=m_{p}$, $a_{\pi^{\prime}}^{d_{p}}=a_{\pi^{\prime}}^{b_{p}^{y}}=a_{\pi^{\prime}}^{\bar{b}_{p}}, c_{p}^{d_{p}}=c_{p}^{R_{p}}$ and $d_{p}^{n_{p}}=c_{p}^{s_{p}}$, as desired. This finishes the proof of the claim.

For every $p \in \pi$ let $c_{p}$ and $d_{p}$ as in the claim and set $c=a_{\pi^{\prime}} \prod_{p \in \pi} c_{p}$ and $d=b_{\pi^{\prime}} \prod_{p \in \pi} d_{p}$ we deduce that $G=\langle c, d\rangle$ with $|c|=m, d^{n}=c^{s}$ and $c^{d}=a^{\bar{t}}$. Therefore $G \cong \bar{G}$.

The following corollary is a direct consequence (1) implies (2) of Theorem 3.6. It shows that $\Delta_{G}$ is well defined.

Corollary 3.7. If $G=A B=C D$ are two minimal factorizations of $G$ then $\Delta(A B)=$ $\Delta(C D)$.

## 4 Proofs of the main results

Proof of Theorem $A$. Let $G$ and $\bar{G}$ be finite metacyclic groups and let $G=A B$ and $\bar{G}=\bar{A} \bar{B}$ be minimal metacyclic factorizations of $G$ and $\bar{G}$ respectively. Denote $m=|A|, \bar{m}=|\bar{A}|$, $n=[G: A], \bar{n}=[\bar{G}: \bar{A}], s=[G: B], \bar{s}=[\bar{G}: \bar{B}], T=T_{G}(A)$ and $\bar{T}=T_{\bar{G}}(\bar{A})$. We also denote $m^{\prime}=[T, n, s], \bar{m}^{\prime}=[\bar{T}, \bar{n}, \bar{s}], \Delta=\operatorname{Res}_{m^{\prime}}(T)$ and $\bar{\Delta}=\operatorname{Res}_{\bar{m}^{\prime}}(\bar{T})$. Then $G \cong \mathcal{G}_{m, n, s, T}$, $\bar{G} \cong \mathcal{G}_{\bar{m}, \bar{n}, \bar{s}, \bar{T}}, m=m_{G}, n=n_{G}, s=s_{G}, \bar{n}=n_{\bar{G}}, \bar{m}=m_{\bar{G}}, s=s_{\bar{G}}, T$ is $(n, s)$-canonical and $\bar{T}$ is $(\bar{n}, \bar{s})$-canonical. Moreover, $\Delta=\Delta_{G}$ and $\bar{\Delta}=\Delta_{\bar{G}}$.

If $G \cong G^{\prime}$ then $m=\bar{m}, n=\bar{n}, s=\bar{s}$ and, by Theorem 3.6 we have $\Delta=\bar{\Delta}$. Thus $\operatorname{MCINV}(G)=\operatorname{MCINV}(\bar{G})$.

Conversely, if $\operatorname{MCINV}(G)=\operatorname{MCINV}(\bar{G})$ then $m=|A|=m_{G}=m_{\bar{G}}=|\bar{A}|=\bar{m}$ and similarly $n=\bar{n}$ and $s=\bar{s}$. Moreover, $\operatorname{Res}_{m^{\prime}}[T]=\Delta_{G}=\Delta_{\bar{G}}=\operatorname{Res}_{\bar{m}^{\prime}}(\bar{T})$. Then $G \cong \bar{G}$ by Theorem 3.6.

In the remainder of the section we use the notation in Theorem B.
Proof of 1. implies 2. in Theorem B. Suppose that $(m, n, s, \Delta)=\operatorname{MCINV}(G)$ for some metacyclic group $G$ and let $G=A B$ be a minimal factorization of $G$. Then $m=m_{G}=|A|$, $n=n_{G}=[G: A], s=s_{G}=[G: B]$ and if $T=T_{G}(A)$ then $\Delta=\Delta(A B)=\operatorname{Res}_{m^{\prime}}(T)$. In particular, $s \mid m, T$ is a cyclic subgroup of $\mathcal{U}_{m}^{n, s},[T]=[\Delta]$ and $m_{\nu}^{\prime}=m_{\nu}$. Moreover, $\nu=\pi\left(m^{\prime}\right) \backslash \pi(r)$ and $s_{\nu}=m_{\nu}$, by Lemma 3.1. Moreover, $|\Delta|$ divides $n$, because it divides $|T|$, which in turn divides $n$. Then conditions (2a) and (2b) of Theorem B hold. By Lemma 2.2, Lemma 3.1 and Lemma 3.2 we have $\pi=\pi_{G}, \pi_{G}^{\prime}=\nu, o=o_{G}, \epsilon=\epsilon_{G}$ and $r=r_{G}$. Let $p \in \pi(r)$. If $\epsilon^{p-1}=1$ then $\frac{m_{p}}{r_{p}}=\left|\operatorname{Res}_{m_{p}}\left(T_{p}\right)\right| \leq n_{p}$ and if $\epsilon=-1$ then $\max \left(2, \frac{m_{2}}{r_{2}}\right)=$ $\left|\operatorname{Res}_{m_{2}}\left(T_{2}\right)\right| \leq\left|T_{2}\right| \leq n_{2}$ and $m_{2} \leq 2 s_{2}$. As the metacyclic factorization $G=A B$ is minimal, $T$ is $(n, s)$-canonical by Proposition 3.4. Then the remaining conditions in (2c) and (2d) follow.

Proofs of Theorem $C$ and 2. implies 1. in Theorem B. Suppose that $m, n, s$ and $\Delta$ satisfy the conditions of 2 . in Theorem B. By Remark 1.2 there is a cyclic subgroup $T$ of $\mathcal{U}_{m}^{n, s}$ with $\operatorname{Res}_{m^{\prime}}(T)=\Delta$ and $[T]=[\Delta]$. Let $t \in \mathbb{N}$ with $T=\langle t\rangle_{m}$. Let $G=\mathcal{G}_{m, n, s, t}$ and denote $A=\langle a\rangle$ and $B=\langle b\rangle$. We will prove that $G=A B$ is a minimal factorization of $G$ that $m=|A|$, $n=[G: A], s=[G: B]$ and $\Delta=\Delta(A B)$. This will complete the proofs of Theorem B and Theorem C.

Of course $G=A B$ is a metacyclic factorization of $G$ and $T=T_{G}(A)$. Since $m_{\nu}=s_{\nu}, n$ is multiple of $|\Delta|$ and $\left|\operatorname{Res}_{m_{\nu}}(T)\right|=\left|\operatorname{Res}_{m_{\nu}}(\Delta)\right|$, it follows that $\left|\operatorname{Res}_{m_{\nu}}(T)\right|$ divides $n$ and $s(t-1)$. On the other hand if $p \mid r$ then $t \equiv \epsilon^{p-1}+r_{p} \bmod m_{p}$. Therefore, if $\epsilon^{p-1}=1$ then $\left.o_{m_{p}}(t)=\frac{m_{p}}{r_{p}} \right\rvert\, n$ and $s(t-1) \equiv s r_{p} \equiv 0 \bmod m_{p}$. Otherwise, i.e. if $\epsilon=-1$ and $p=2$, then $2||\Delta|| n$ and $\frac{m_{2}}{r_{2}} \leq n_{2}$ and $m_{2} \mid 2 s$. Thus $o_{m_{2}}(t)=o_{m_{2}}\left(-1+r_{2}\right)=\max \left(2, \frac{m_{2}}{r_{2}}\right) \leq n_{2}$ and $m_{2} \mid t(s-1)$. This shows that $m$ divides both $t^{n}-1$ and $s(t-1)$, i.e. $T \subseteq \mathcal{U}_{m}^{n, s}$. Then $|A|=m$ and $[G: A]=n$, and hence $[G: B]=s$. From condition (2b) we have that $\Delta=\operatorname{Res}_{m^{\prime}}\left(T_{G}(A)\right)=\Delta(A B)$ and from conditions (2d) and (2c) it follows that $T$ is $(n, s)$-canonical. Then the metacyclic factorization $G=A B$ is minimal by Proposition 3.4.

Having in mind that a metacyclic group is nilpotent if and only if $o_{G}=1$ one can easily obtain from Theorem B a description of the finite nilpotent metacyclic groups or equivalently the values of the lists of metacyclic invariants of the finite nilpotent metacyclic groups. Observe that (1) corresponds to cyclic groups, (2) to 2-generated abelian groups, (3) to non-abelian nilpotent metacyclic groups $G$ with $\epsilon_{G}=1$ and (4) to metacyclic nilpotent groups with $\epsilon_{G}=-1$.

Corollary 4.1. Let $m, n, s \in \mathbb{N}$ and $t \in \mathbb{N} \cup\{0\}$. Then ( $m, n, s, t$ ) is the list of metacyclic invariants of a finite metacyclic nilpotent group if and only if $s \mid m, t<m$ and one of the following conditions hold:

1. $m=1$.
2. $t=1$ and $s=m \leq n$.
3. $\pi(t-1)=\pi(m), \operatorname{lcm}\left(t-1, \frac{m}{t-1}\right)|s| n$ and if $4 \mid m$ then $4 \mid t-1$.
4. There is a divisor $r$ of $s_{2^{\prime}} m_{2}$ such that $\pi(r)=\pi(m), 4 \mid r, t \equiv 1+r_{2^{\prime}} \bmod m_{2^{\prime}}$, $t \equiv-1+r_{2} \bmod m_{2}, \frac{m_{2^{\prime}}}{r_{2^{\prime}}}\left|s_{2^{\prime}}\right| n_{2^{\prime}}, \max \left(2, \frac{m_{2}}{r_{2}}\right) \leq n_{2}, m_{2} \leq 2 s_{2}$ and $s_{2} \neq n_{2} r_{2}$. If moreover $4 \mid n$ and $8 \mid m$ then $r_{2} \leq s_{2}$.

In that case $\mathcal{G}_{m, n, s, t}$ is nilpotent with metacyclic invariants ( $m, n, s, t$ ).

## 5 A GAP implementation

In this section we show how we can use the results in previous sections to construct some GAP functions for calculations with finite metacyclic groups. The code of these functions is available in [3]. We start with two auxiliar functions. We call metacyclic parameters to any list $(m, n, s, t)$ with $m, n, s \in \mathbb{N}$ and $[t]_{m} \in \mathcal{U}_{m}^{n, s}$, i.e. $s(t-1) \equiv t^{n}-1 \bmod m$. In that case

MetacyclicGroupPC([m,n,s,t]) outputs the group $\mathcal{G}_{m, n, s, t}$ with a power-conjugation presentation. The boolean function IsMetacyclic returns true if the input is a finite metacyclic and false otherwise.

```
gap> G:=MetacyclicGroupPC([10,20,5,3]);
<pc group of size 200 with 5 generators>
gap> IsMetacyclic(G);
true
gap> Filtered([1..16],x->IsMetacyclic(SmallGroup(100,x)));
[ 1, 2, 3, 4, 5, 6, 8, 9, 14, 16 ]
```

To introduce the next function we start presenting an algorithm that uses Algorithm 1 to compute $\operatorname{MCINV}(G)$ for a given metacyclic group $G$. Observe that in Algorithm 1 the values of $m=|a|, n=[G:\langle a\rangle], s=[G:\langle a\rangle]$ and $(r, \epsilon, o)=\left[T_{G}(\langle a\rangle)\right]$ are updated along the calculations. We use this in step 2 of the following algorithm.

Algorithm 2. Input: A finite metacyclic group $G$.
Output: $\operatorname{MCINV}(G)$.

1. Compute a metacyclic factorization $G=A B$ of $G$.
2. Perform Algorithm 1 with input $(A, B)$ saving not only the output $(\langle a\rangle,\langle b\rangle)$ but also $m, n, s, r, \epsilon$ and o computed along.
3. Compute $m^{\prime}$ using (1.1) and $t \in \mathbb{N}$ such that $a^{b}=a^{t}$.
4. Return $\left(m, n, s, \operatorname{Res}_{m^{\prime}}\left(\langle t\rangle_{m}\right)\right)$.

A slight modification of Algorithm 2 allows the computation of the list of metacyclic invariants of a finite metacyclic group:

Algorithm 3. Input: A finite metacyclic group $G$.
Output: The list of metacyclic invariants of $G$.

1. Compute a metacyclic factorization $G=A B$ of $G$.
2. Perform Algorithm 1 with input $(A, B)$ saving not only the output $(\langle a\rangle,\langle b\rangle)$ but also $m, n, s, r$ and $\epsilon$ computed along.
3. Compute $m^{\prime}$ using (1.1) and $t \in \mathbb{N}$ such that $a^{b}=a^{t}$ and set $\Delta:=\operatorname{Res}_{m^{\prime}}\left(\langle t\rangle_{m}\right)$.
4. Use the Chinese Remainder Theorem to compute the unique $1 \leq t \leq m_{\pi(r)}$ such that $t \equiv \epsilon^{p-1}+r_{p} \bmod m_{p}$ for every $p \in \pi(r)$.
5. While $\operatorname{gcd}\left(t, m^{\prime}\right) \neq 1$ or $\langle t\rangle_{m^{\prime}} \neq \Delta, t:=t+m_{\pi(r)}$.
6. Return ( $m, n, s, t$ ).

Observe that $G=\langle a\rangle\langle b\rangle$ is a minimal metacyclic factorization at step 2 of Algorithm 3, and $m=m_{G}, n=n_{G}$ and $s=s_{G}$. At step 3 , we have $T_{G}(\langle a\rangle)=\langle t\rangle_{m}$ and hence $G \cong \mathcal{G}_{m, n, s, t}$ and $\Delta=\Delta_{G}=\operatorname{Res}_{m^{\prime}}\left(\langle t\rangle_{m}\right)$. However, this $t$ is not $t_{G}$ yet. The $t$ at step 4 is the smallest one
with $t \equiv \epsilon^{p-1}+r_{p} \bmod m_{p}$ for every $p \in \pi(r)$ and the next steps search for the first integer $t$ satisfying this condition as well as representing an element of $\mathcal{U}_{m}$ with $\operatorname{Res}_{m^{\prime}}\left(\langle t\rangle_{m}\right)=\Delta$.

The GAP function MetacyclicInvariants implements Algorithm 3. For example in the following calculations one computes the metacyclic invariants of all the metacyclic groups of order 200.

```
gap> mc200:=Filtered([1..52],i->IsMetacyclic(SmallGroup(200,i)));;
gap> List(mc200,i->MetacyclicInvariants(SmallGroup(200,i)));

The GAP functions MCINV and MCINVData implement Algorithm 2 representing MCINV $(G)$ in two different ways. While $\operatorname{MCINV}(G)$ outputs $\operatorname{MCINV}(G)$ if $G$ is a metacyclic group, MCINVData ( G ) ouputs a 5 -tuple $\left[\mathrm{m}, \mathrm{n}, \mathrm{s}, \mathrm{m}^{\prime}, \mathrm{t}\right]$ such that $\operatorname{MCINV}(G)=\left(m, n, s,\langle t\rangle_{m^{\prime}}\right)$. The input data G can be replaced by metacyclic parameters $[m, n, s, t]$ representing the group $\mathcal{G}_{m, n, s, t}:$

```
gap> G:=SmallGroup (384,533);
<pc group of size 384 with 8 generators>
gap> MetacyclicInvariants(G);
[ 8, 48, 4, 5 ]
gap> x:=MCINV(G);
[ 8, 48, 4, <group of size 1 with 1 generator> ]
gap> y:=MCINVData(G);
[ 8, 48, 4, 4, 1 ]
gap> x[4]=Group(ZmodnZObj(y[5],y[4]));
true
gap> H:=MetacyclicGroupPC([8,48,4,5]);
<pc group of size 384 with 8 generators>
gap> IdSmallGroup(H);
[ 384, 533 ]
gap> MetacyclicInvariants([20,4,8,11]);
[ 4, 20, 4, 3 ]
gap> MCINVData([20,4,8,11]);
[4, 20, 4, 4, 3 ]
```

Note that two finite metacyclic groups $G$ and $H$ are isomorphic if and only if $\operatorname{MCINV}(G)=$ $\operatorname{MCINV}(H)$ if and only if $G$ and $H$ have the same metacyclic invariants. The function AreIsomorphicMetacyclicGroups uses this to decide if two metacyclic groups $G$ and $H$ are isomorphic. It outputs true if $G$ and $H$ are isomorphic finite metacyclic groups and false if they are finite metacyclic groups but they are not isomorphic. In case one of the inputs is not a finite metacyclic group then it fails. The input data $G$ and $H$ can be replaced by metacyclic parameters of them.

```
gap> H:=MetacyclicGroupPC([100,30,10,31]);
<pc group of size }3000\mathrm{ with }7\mathrm{ generators>
```

```
gap> K:=MetacyclicGroupPC([300,30,10,181]);

[ 50, 180, 10, 31 ]
```

We now explain a method to compute all the metacyclic group of a given order $N$. We start producing all the tuples $(m, n, s, r, \epsilon, o)$ such that $\operatorname{MCINV}(G)=(m, n, s, \Delta)$ and $[\Delta]=(r, \epsilon, o)$ for some finite metacyclic group $G$ and some cyclic subgroup $\Delta$ of $\mathcal{U}_{m^{\prime}}$ with $m^{\prime}$ as in (1.1). For such group $G$ we denote $\operatorname{IN}(G)=(m, n, s, r, \epsilon, o)$. The following lemma characterizes when a given tuple ( $m, n, r, s, r, \epsilon, o$ ) equals $\operatorname{IN}(G)$ for some finite metacyclic group:

Lemma 5.1. Let $m, n, s, r, o \in \mathbb{N}$ and $\epsilon \in\{1,-1\}$ and let $\pi^{\prime}=\pi(m) \backslash \pi(r)$ and $\pi=$ $\pi(m n) \backslash \pi^{\prime}$. Then $\operatorname{IN}(G)=(m, n, s, r, \epsilon, o)$ for some finite metacyclic group $G$ if and only if the following conditions hold:
(A) $s|m, r| m, o\left|n_{\pi}, m_{\pi}\right| r n, m_{\pi} \mid r s, s_{\pi^{\prime}}=m_{\pi^{\prime}}$ and if $4 \mid m$ then $4 \mid r$.
(B) If $p \in \pi(r)$ and $\epsilon^{p-1}=1$ then $s_{p} \mid n$ and either $r_{p} \mid s$ or $s_{p} o_{p} \nmid n$.
(C) If $\epsilon=-1$ then $2|n, 4| m, m_{2} \mid 2 s, s_{2} \neq n_{2} r_{2}$. If moreover $4|n, 8| m$ and $o_{2}<n_{2}$ then $r_{2} \mid s$.
(D) $o \mid \operatorname{lcm}\left\{q-1: q \in \pi^{\prime}\right\}$ and for every $q \in \pi^{\prime}$ with $\operatorname{gcd}(o, q-1)=1$ there is $p \in \pi^{\prime} \cap \pi(n)$ with $p \mid q-1$.

Proof. Suppose first that $(m, n, s, r, \epsilon, o)=\operatorname{IN}(G)$ for some finite metacyclic group $G$. Then $\operatorname{MCINV}(G)=(m, n, s, \Delta)$ for some cyclic subgroup $\Delta$ of $\mathcal{U}_{m^{\prime}}$ with $[\Delta]=(r, \epsilon, o)$. Then the conditions in statement 2. of Theorem B hold and this implies that conditions (A)-(C) hold. To prove (D) we fix a metacyclic factorization $G=A B$ and observe that $o=o_{G}(A)=$ $\left|\operatorname{Res}_{m_{\pi^{\prime}}}\left(T_{G}(A)\right)_{\pi}\right|$ and $\operatorname{Res}_{m_{\pi^{\prime}}}\left(T_{G}(A)\right)_{\pi}$ is a cyclic subgroup of $\left(\mathcal{U}_{m_{\pi^{\prime}}}\right)_{\pi}$. Then $o$ divides the exponent of $\left(\mathcal{U}_{m_{\pi^{\prime}}}\right)_{\pi}$ which is $\operatorname{lcm}\left\{(q-1)_{\pi}: q \in \pi^{\prime}\right\}$. This proves the first part of (D). To prove the second one we take $q \in \pi^{\prime}$ such that $\operatorname{gcd}(o, q-1)=1$. By Lemma 3.1.(4), we have $\operatorname{Res}_{q}\left(T_{G}(A)\right) \neq 1$. However $\operatorname{Res}_{q}\left(T_{G}(A)\right)_{\pi} \mid \operatorname{gcd}(o, q-1)=1$ and hence, if $p$ is a divisor of $\operatorname{Res}_{q}\left(T_{G}(A)\right)$ then $p\left|\left|U_{q}\right|=q-1, p\right|[G: A]=n$ and $p \notin \pi$, so that $p \in \pi^{\prime}$. This finishes the proof of (D).

Conversely, suppose that conditions (A)-(D) hold. By condition (D), $2 \notin \pi^{\prime}$ and hence if $q \in \pi^{\prime}$ then $\mathcal{U}_{m_{q}}$ is cyclic of order $\varphi\left(m_{q}\right)$. Therefore for every $q \in \pi^{\prime}$, the group $\mathcal{U}_{q}$ contains a cyclic subgroup of order $q-1$. Therefore $\mathcal{U}_{m}$ contains a cyclic subgroup of order $k=\operatorname{lcm}\{q-1$ : $\left.q \in \pi^{\prime}\right\}$. Furthermore, by (D), for every $p \in \pi$ we have that $o_{p} \mid k$ and hence $o_{p} \mid q-1$ for some $q \in \pi^{\prime}$. Then $\mathcal{U}_{m_{q}}$ contains an element of order $o_{p}$ and, as $\mathcal{U}_{m_{\pi^{\prime}}} \cong \prod_{q \in \pi^{\prime}} \mathcal{U}_{m_{q}}$, it follows that $\mathcal{U}_{m_{\pi^{\prime}}}$ contains an element of order $o$. Let $\tau=\left\{q \in \pi^{\prime}: \operatorname{gcd}(o, q-1)=1\right\}$. By (D), for
every $q \in \tau$ there is $p_{q} \in \pi^{\prime} \cap \pi(n)$ such that $p_{q} \mid q-1$. Let $h=\prod_{q \in \tau} p_{q}$. For every $q \in \tau$, there is an element in $\mathcal{U}_{m_{q}}$ of order $p_{q}$. Then $\mathcal{U}_{m_{\tau}}$ has an element of order $h$. As $o \mid n_{\pi}$ and $h \mid n_{\pi^{\prime}}, \mathcal{U}_{m_{\pi^{\prime}}}$ has a cyclic subgroup $S$ of order oh. Then Aut $\left(C_{m}\right)$ has a cyclic subgroup $T$ such that $\operatorname{Res}_{m_{\pi^{\prime}}}(T)=S$ and $\operatorname{Res}_{m_{p}}(T)=\operatorname{Res}_{m_{p}}(T)=\left\langle\epsilon^{p-1}+r_{p}\right\rangle_{m_{p}}$ for every $p \in \pi$. By condition (B), if $p \in \pi(r)$ and $\epsilon^{p-1}=1$ then $\left.\left|\operatorname{Res}_{m_{p}}(T)\right|=\frac{m_{p}}{r_{p}} \right\rvert\, n_{p}$. By condition (C), if $\epsilon=-1$ then $2 \in \pi, 2 \mid n$ and $\left.\frac{m_{2}}{r_{2}} \right\rvert\, n$ by (A). Thus $\left.\left|\operatorname{Res}_{m_{p}}(T)\right|=\max \left(2, \frac{m_{2}}{r_{2}}\right) \right\rvert\, n$. Then $\left|\operatorname{Res}_{m_{p}}(T)\right|$ divides $n$ for every $p \in \pi$. This implies that $|T|=\operatorname{lcm}\left(|S|,\left|\operatorname{Res}_{m_{p}}(T)\right|, p \in \pi\right)$ and this number divides $n$. On the one hand we have $s_{p^{\prime}}=m_{\pi^{\prime}}$ and if $p \in \pi$ then either $m_{p} \mid$ rs or $p=2, \epsilon=-1$ and $2 m_{2} \mid s$. Using this it is easy to see that $\operatorname{Res} \frac{m}{s}(T)=1$. This proves that $T \subseteq \mathcal{U}_{m}^{n, s}$ and by the election of $T$ it follows that $[T]=(r, \epsilon, o)$. Moreover, from conditions (B) and (C), it follows that $T$ is $(n, s)$-canonical and hence $\mathcal{G}_{m, n, s, T}=\langle a\rangle\langle b\rangle$ is a minimal factorization. Thus $\operatorname{IN}\left(\mathcal{G}_{m, n, s, T}\right)=(m, n, s, r, \epsilon, o)$, as desired.

Our last algorithm is based in Lemma 5.1 and computes a list containing exactly one representative of each isomorphism class of the metacyclic groups of a given order.

Algorithm 4. Input: A positive integer $N$.
Output: A list containing exactly one representative of each isomorphism class of the metacyclic groups of order $N$.

1. $M:=[]$, an empty list, $\pi^{\prime}:=\pi(m) \backslash \pi(r), \pi^{\prime}:=\pi(N) \backslash \pi^{\prime}$.
2. $P:=\{(m, n, s, r, \epsilon, o): n, m, s, r, o \in \mathbb{N}, \epsilon \in\{1,-1\}, N=m n$ and conditions (A)-(D) hold $\}$.
3. For each $(m, n, s, r, \epsilon, o) \in P$ :
(a) $m^{\prime}:=m_{\pi^{\prime}} \prod_{p \in \pi(r)} m_{p}^{\prime}$ with $m_{p}^{\prime}$ as in (1.1) and $s^{\prime}:=\frac{s m^{\prime}}{m}$.
(b) For every cyclic subgroup $\Delta$ of $\mathcal{U}_{m^{\prime}}^{n, s^{\prime}}$ with $[\Delta]=(r, \epsilon, o)$ :

- Select a cyclic subgroup $T$ of $\mathcal{U}_{m}$ such that $\operatorname{Res}_{m^{\prime}}(T)=\Delta$.
- Add $\mathcal{G}_{m, n, s, T}$ to the list $M$.

4. Return the list $M$.

Observe that if ( $m, n, s, r, \epsilon, o$ ) satisfy conditions (A)-(D) then $m$ divides $s m^{\prime}$. Indeed, if $p \nmid r$ then $m_{p}=m_{p}^{\prime}$. If $\epsilon=-1$ then $\frac{m_{2}}{2}$ divides $s$ and $2 \mid m^{\prime}$, hence in this case $\left.\frac{m_{2}}{s_{2}} \right\rvert\, m^{\prime}$. Finally, if $p \in \pi(r)$ and $\epsilon^{p-1}=1$. Then $p \in \pi$ and hence $m_{p} \leq r_{p} s_{p}$ by condition (A). Therefore $\frac{m_{p}}{s_{p}} \leq \min \left(m_{p}, r_{p} o_{p}\right)$. If $r_{p} \mid s_{p}$ then also $\frac{m_{p}}{s_{p}} \leq s_{p}$. Otherwise $s_{p} o_{p} \nmid n$ and hence $r_{p} \frac{s_{p} o_{p}}{n_{p}}>r_{p} \geq \frac{m_{p}}{s_{p}}$. This proves that $\left.\frac{m_{p}}{s_{p}} \right\rvert\, m^{\prime}$ for every prime $p$, so that $m \mid s m^{\prime}$, as desired. This justify that $s^{\prime} \in \mathbb{N}$ is step (3a).

On the other hand if $T$ is as in (3b) then $T \subseteq \mathcal{U}_{m}^{n, s}$. Indeed, $\frac{m}{s}=\frac{m^{\prime}}{s^{\prime}}$ and hence $\operatorname{Res} \frac{m}{s}(T)=$ $\operatorname{Res}_{\frac{m^{\prime}}{s^{\prime}}}(\Delta)=1$. Moreover $\operatorname{Res}_{m_{\pi^{\prime}}}(T)=\operatorname{Res}_{m_{\pi^{\prime}}^{\prime}}(\Delta)$ and hence $\left|\operatorname{Res}_{m_{\pi^{\prime}}}(T)\right|$ divides $n$. On the other hand $[T]=(r, \epsilon, o)=[T]$ and hence if $\epsilon^{p-1}=1$ then $\left.\left|\operatorname{Res}_{m_{p}}(T)\right|=\frac{m_{p}}{r_{p}} \right\rvert\, n$, by (A). Otherwise $\left|\operatorname{Res}_{m_{2}} T_{2}\right|=\max \left(2, \frac{m_{2}}{r_{2}}\right)$ which divides $n$ by (A) and (C).

The function MetacyclicGroupsByOrder (N) implements a combination of Algorithm 3 and Algorithm 4 and returns the complete list of metacyclic invariants of metacyclic groups of order $N$.
